

## 8.3 Photosynthesis

### Energy Transfer

Write a chemical equation for the process of photosynthesis

Outline the organisation of photosynthetic pigments into photosystems

Photosynthetic pigments absorb different wavelengths of light, so to maximise light absorption they are grouped into photosystems (with accessory pigments passing electrons to a central reaction centre)

Identify the two stages of photosynthesis

1. Light dependent reactions
2. Light independent reactions (i.e. Calvin cycle)

### Chloroplasts

Label the different parts of a chloroplast

1. Outer membrane
2. Stroma
3. Inner membrane
4. Thylakoid
5. Granum

Explain the relationship between the structure of the chloroplast and its function

| Structure | Function                                                                   |
|-----------|----------------------------------------------------------------------------|
| Thylakoid | Disc shaped with small lumen (small volume maximises proton gradient)      |
| Grana     | Thylakoids organised into stacks (increases SA:Vol ratio)                  |
| Stroma    | Contains appropriate enzymes and suitable pH for the Calvin cycle to occur |

**Biochemistry of Scandium and Yttrium, Part 1: Physical and Chemical Fundamentals** Chaim T. Horovitz, 1999-11-30 Biochemistry of Scandium and Yttrium gathers together existing knowledge about scandium and yttrium from a wide variety of disciplines Part 1 will present a comparative study of the physical and chemical properties of scandium and yttrium looking at both their similarities and their differences Part 2 will address the biochemical aspects of these two elements and the various medical and environmental applications While these elements are relatively rare in nature these books will show that they have unusual physical and chemical properties and a disproportionate number of important applications Improved analytical techniques have revealed that scandium and yttrium are present throughout living matter even though only a relatively limited number of species have been analyzed so far This fact of course has far ranging implications for biological and environmental concerns Part 1 also contains a discussion of the interactions of scandium and yttrium with molecules of biological interest such as organic acids carbohydrates proteins nucleotides and other biologically active molecules The major impacts of scandium and yttrium in science technology and medicine will be of interest to a wide variety of researchers including geochemists inorganic and organic chemists clinical biochemists and those specializing in environmental protection Biochemistry of Scandium and Yttrium Part 1 and Part 2 will be especially welcome because the last book published on the biochemistry of scandium appeared over 20 years ago and the only book mentioning the biochemistry of yttrium came out in 1990

As such respiration is an essential component of a plant's carbon budget. Depending on species and environmental conditions it consumes 25–75% of all the carbohydrates produced in photosynthesis, even more at extremely slow growth rates. Respiration in plants can also proceed in a manner that produces neither metabolic energy nor carbon skeletons but heat. This type of respiration involves the cyanide-resistant alternative oxidase, which is unique to plants and resides in the mitochondria. The activity of this alternative pathway can be measured based on a difference in fractionation of oxygen isotopes between the cytochrome and the alternative oxidase. Heat production is important in some flowers to attract pollinators; however, the alternative oxidase also plays a major role in leaves and roots of most plants. A common thread throughout this volume is to link respiration, including alternative oxidase activity, to plant functioning in different environments.
