The Role of Chemical Markers and Chemometrics in the Identification of Grasses Used as Food in Pre-agrarian South West Asia Michelle Cave, 2004 This work explores the way in which novel chemical criteria can be used to identify charred remains of grains of small grained grasses used as food by pre agrarian hunter gatherers in south western Asia but which have hitherto rarely been identified with any precision The grass family Gramineae or Poaceae is the most diverse abundant and widespread family of higher plants on the planet Grasses correspondingly have enormous ecological and economic importance worldwide Their importance is reflected in the

prominent role of grain from wild grasses in hunter gatherer subsistence In order to reconstruct past subsistence practices and diet especially of arid zone hunter gatherers it is important to identify the remains of grasses recovered from archaeological sites However the recovered grass remains are most often charred therefore the interpretive potential can be realized only if these charred remains are accurately identified at the level of genus and in some cases species There are enormous problems in identifying charred remains particularly when relying totally on gross morphological criteria There is therefore a need for alternative criteria such as that utilized by chemical analytical techniques The core rationale in applying the different chemical techniques is the same throughout grains are taken from modern grasses of known identity and spanning a spectrum of taxa likely to include all the charred ancient specimens to be identified the unknowns These modern grains are then analysed to generate spectra Equivalent spectra from unknowns are then compared with those from the modern grains to effect an identification Standard practice has hitherto involved comparing the two sets of spectra know and unknowns by visual inspection i e by eye However identifications based on such comparisons are inevitably to some degree untestable and unrepeatable and this represents a long standing problem in chemistry generally In the present project the author has therefore explored the use of chemometrics i e the use of statistical systems to compare spectra in a manner that is rigorously testable and repeatable This is an entirely new development and has never previously been applied in the analysis of archaeological data Environmental Chemometrics Grady Hanrahan,2009 Multivariate heterogeneous data has been traditionally analyzed using the one at a time variable approach often missing the main objective of discovering the relationships among multiple variables and samples This title provides an introduction to chemometric methods used in environmental chemical analysis **Physical Chemistry Calculations** Rodney J. Sime,2005 Physical Chemistry Calculations is a practical guide for students and instructors who want to learn how to use the most popular spreadsheet and computational software to solve problems in physical chemistry The book provides students with a complementary approach to the chemistry and physics they are learning in the classroom Physical Chemistry Calculations also gives a solid introduction to calculations with Excel VB VBA MathCad and Mathematica
