

Enzymes

- the chemistry of life is organized into metabolic pathways
- all metabolic pathways consist of a series of reactions which convert one molecule (the reactant) into another (the product)
- a specific enzyme catalyzes each step of the pathway
- 2 types of pathways:
 - Catabolic pathways**
 - release energy by breaking down complex molecules to simpler compounds
 - cellular respiration
 - Anabolic pathways**
 - consume energy to build complicated molecules from simpler compounds
 - synthesis of protein from amino acids
- chemical reactions can be classified as either exergonic or endergonic based on the change in energy that occurs because of the reaction
 - endergonic reaction - absorbs energy
 - exergonic reaction - releases energy

Energy in chemical reactions

- many chemical reactions occur spontaneously in cells but at very slow rates
 - enzymes lower energy barriers
 - act as a **catalyst**
 - speeds up** rate of reaction
 - is **not consumed** in the process
- the initial investment of energy for starting a reaction is the activation energy (E_a)
 - this is the amount of energy necessary to push the reactants over an energy barrier so that the reaction can proceed
 - heat would speed up reactions, but it would also denature proteins and kill cells
 - enzymes lower E_a
