**REINFORCEMENT LEARNING: FOUNDATIONS, ALGORITHMS AND APPLICATIONS** Dr. Darío Salguero García,Deepti Razdan,Ismail Keshta,Dr. Haewon

Byeon,2023-09-18 Reinforcement learning sometimes known as RL is a catchall word that refers to both a learning problem and a subfield in machine learning In the context of a problem involving learning this refers to the process of determining how to guide a computer toward an arbitrary numerical objective The process of reinforcement learning may be seen in its usual application in the controller is provided with both the present state of the system under their control as well as the reward earned from the most recent transition After that the system will calculate an answer and then provide it to you Because of this the system goes through a state transition and the process starts all over again Figuring out how to have the most possible impact on the system in order to get the greatest possible advantage from it is the task at hand here The gathering of data and the measurement of performance are two areas in which the learning obstacles are distinct In this context we make the assumption that the target system is by its very nature unpredictable In addition we make the assumption that the measures of state that are now accessible are detailed enough so that the controller does not need to speculate on how to get state information The Markovian decision processes often known as MDPs provide a helpful framework for modeling issues that include these characteristics MDPs are often solved via the use of dynamic programming which in practice does nothing more than recast the initial problem as one involving the selection of an acceptable value function Dynamic programming on the other hand is impractical in all but the most elementary of situations namely those in which the MDP has a limited number of states and actions The RL algorithms that we give here may be seen as a method that can be utilized to turn unfeasible dynamic programming into usable algorithms that can be used to real world applications on a huge scale The reason why RL algorithms are able to do this task is due to two key assumptions The fundamental idea is to illustrate the dynamics of the control issue in a more concise way by utilizing samples This is crucial for two reasons which are as follows To begin it makes it easier to handle learning circumstances that include dynamics that are unknown
