

12.2 Check the bolts for signs of wear like those - if it looks worn, replace it

expensive. For a faster charge, you can use a higher amperage charger, but don't use one rated more than 1/10th the amp-hour rating of the battery. Rapid boost charges that claim to restore the power of the battery in less than two hours are based on the battery and can damage batteries not in good condition. The type of charging should only be used in emergency situations.

11. The average time necessary to charge a battery should be listed in the instructions that come with the charger. As a general rule, a motor-charger will charge a battery in 12 to 16 hours.

12. Remove all the cell caps (if equipped) and cover the holes with a clean cloth to prevent splashing electrolyte. Reconnect the negative battery cable and hook the battery charger cable across up to the battery post opposite in position. Negative to negative; then plug in the charger. Make sure it is set at 15 volts if it has a voltage switch.

13. If you're using a charger with a rate higher than two amps, check the battery regularly during charging to make sure it doesn't overheat. If you're using a three-amp charger, you can safely let the battery charge overnight after you've checked it regularly for the first couple of hours.

14. If the battery has terminals cast into one, disconnect the specific parts with a hydrometer after every hour during the last few hours of the charging cycle. Hydrometers are available inexpensively from auto parts stores. Follow the instructions that come with the hydrometer. Remember the battery charged when there's no change in the specific gravity reading the two hours into the electrolyte in the cells is proving troubling. Usually, the specific gravity reading from each cell should be very close to

the others. If not, the battery probably has a bad cell.

15. Some batteries with sealed tops have built-in hydrometers on the top that indicate the state-of-charge by the color treatment in the hydrometer window. Normally, a bright-colored hydrometer indicates a full charge and a dark hydrometer indicates the battery still needs charging.

16. If the battery has a sealed top and no built-in hydrometer, you can hook up a digital voltmeter across the battery terminals to check the charge. A fully charged battery should read 12.7 volts or higher.

17. Further information on the battery and jump-starting can be found in Chapter 3 and in the back of this manual.

12.4a The mark (a) on the main bolt's terminal must extend between the marks (b) on the terminal mount (c) above, main bolt

12. Detailed check, adjustment and replacement (every 6000 miles or 6 months)

Refer to illustrations 12.1, 12.2a, 12.2b, 12.3a, 12.3b and 12.5b

1. A serpentine belt is located at the front of the engine and plays an important role in the overall operation of the engine and its components. Due to its function and material make-up, the belt system is wear and should be periodically inspected. The serpentine belt drives the alternator, power steering pump, water pump and air conditioning compressor. Note: All models have one belt. Information here can mean belt and a second, over-belt just for the air conditioning compressor (if equipped).

2. With the engine off, open the hood and use your fingers (and a flashlight, if necessary) to move along the belt checking for cracks and separation of the belt plies. Also check for fraying and glazing, which gives the belt a shiny appearance (see illustration). Both sides of the belt should be inspected, which means you will have to feel the belt to check the underside.

3. Check the underside of the belt. They should lie at the same depth, with none of the surface cracked.

4. The tension of the belt is maintained by a spring-loaded tensioner assembly and isn't adjustable. The belt should be replaced when the mark on the movable part of the tensioner moves out of the acceptable range on the stationary part of the tensioner (see illustration).

5. To replace the belt, slide the tensioner to release belt tension (see illustration). Note: Before removing the belt, make a record of how it is routed around the pulleys. If you don't know you can replace it.

6. Remove the belt from the tensioner and routing components are ready to install the tensioner.

12.4b The distance for the air conditioning compressor (indicated) is smaller (a) to (see). The mark (b) on the movable part of the tensioner must be within the acceptable range marks (c)

12.5a Place a tensioner on the tensioner belt (a) and have the tensioner structure (b) for belt removal

12.5b On V6 models with an air conditioning, the main belt tensioner is fast-removed from factory - use a 1/2 inch structure on the tensioner's support hole (a) to make it (b) for belt removal

7. Route the new belt over the various pulleys, again moving the tensioner to allow the belt to be installed. Then release the belt tensioner.

Tensioner replacement

Refer to illustrations 12.6a and 12.6b

1. To replace a tensioner that has lost its spring tension, replace the tensioner with a new one. Auto parts stores have the mounting bolts (see illustration).

2. Installation is the reverse of the removal process.

12. Underhood hose check and replacement (every 6000 miles or 6 months)

General

Caution: Replacement of an air conditioning hose that is left in a dealer service department or an air conditioning shop that has the

equipment to depressure the system safely and recover the refrigerant. Never remove an air conditioning component or hose until the system has been depressured.

1. High temperatures in the engine compartment can cause the deterioration of the rubber and plastic hoses used for engine, accessory and emission systems. Inspect hoses regularly, always be ready for cracks, loose clamps, material hardening and leaks. Information specific to the cooling system hoses can be found in Section 14.

2. Some fuel and oil hoses are secured to one thing with clamps. Where clamps are used, check to be sure they haven't loosened from vibration, allowing the hose to leak. If clamps aren't used, make sure the hose has not separated under tension when it slips over the fitting, allowing it to leak.

Vacuum hoses

3. It's quite common for vacuum hoses, especially those in the emissions system, to be disconnected or identified by vacuum hoses

marked with marks. Vacuum systems require hoses with different cut-thickness, collapse resistance and temperature resistance. When replacing hoses, be sure the new ones are made of the same material.

4. Often the only effective way to check a hose is to remove it completely from the vehicle. If more than one hose is removed, be sure to label the hoses and things to avoid system confusion.

5. When checking vacuum hoses, be sure to include any plastic fittings in the check against the things for cracks and the hose where it fits over the fitting for distortion, which could cause leakage.

6. A good grade of vacuum hose (1/4 inch inside diameter) can be used as a substitute to replace vacuum hoses that are out of the hose in your car and provide enough vacuum hoses and things, looking for the fitting most components of a vacuum hose. **Warning:** When working with the vacuum hose, be sure to use a vacuum hose that is not used with the engine components that are the most critical for air.
