ABSTRACT

Heat pipe is a special type of heat exchanger that transfers large amount of heat due to the effect of capillary action and phase change heat transfer principle. Recent development in the heat pipe includes high thermal conductivity fluids like nanofluids, sealed inside to extract the maximum heat. This paper reviews, influence of various factors such as heat pipe tilt angle, charged amount of working fluid, nano-particles type, size, and mass/volume fraction and its effect on the improvement of thermal efficiency, heat transfer capacity and reduction in thermal resistance. The nanofluid preparation and the analysis of its thermal characteristics also have been reviewed.

Keywords: heat pipe, nano-fluid, thermal resistance, capillary pressure, tilt angle

1. INTRODUCTION

In the emerging world, the field of electronics is one of the fast developing sciences and its contribution to the technology is rapidly growing day by day. During the end of 20th century, most of the electronic devices were larger in size and they had been adopted with fan or micro fin cooling systems. These cooling methods occupied considerable volume and did not perform effectively whenever heat dissipation is high and this led to high component temperatures, which affect the performance of electronic devices. Due to the advancement in technology, compact devices were developed to dissipate large amount of heat and one such device is a heat pipe. The heat pipes are suitable devices for the cooling purpose and it was first introduced by Gaugler in 1942. Further developments were made by Groover in 1964 at Los Alamos scientific laboratories (Bejan and Kraus, 2003). The design was further modified and some parameters were changed to improve the performance. These are varying the wick structure (Naphon et al., 2009), base fluids (Senthilkumar et al., 2011), inclination angle (Kishorirao et al., 2000; Naphon et al., 2008) operating pressure (Shafahi et al., 2010; Hsainic et al., 2011), charged amount of working fluid (Liu et al., 2011; Moura et al., 2011), dispersion of nano-particles in the base fluid (Kishorirao et al., 2000; Moura et al., 2011), size of particles (Kang et al., 2006; Wang et al., 2010), kind of nano-particles (Kang et al., 2006; Chen, 2010), mass/volume fraction of nano-particles (Liu et al., 2011; Teng et al., 2009), heat input (Liu et al., 2011; Do et al., 2010) and geometry (Liu and Zhu, 2011) of heat pipe.

2. HEAT PIPE AND ITS LIMITATIONS

A heat pipe contains three different sections; an evaporator at one end, a condenser at other end and an adiabatic section in-between. Figure 1 shows the schematic arrangement of a heat pipe (Knuth and Bohn, 1997). Heat pipe is basically a sealed tube having a wick structure on the inner surface and filled with a fluid at saturated state. Evaporator is the place, where heat is absorbed by the fluid which creates temperature

and thus density difference. In the condenser section, heat is rejected to the surrounding medium. The adiabatic section is externally covered with an insulation layer and it is just acting as a flow passage without any heat losses from the working fluid. The addition and removal of heat in the evaporator and condenser sections respectively, induces a pressure difference thus leading to vapor flow from evaporator to condenser. The liquid is attracted into the evaporator due to the capillary pressure in the wick structure and the process repeats.

Fig. 1 Heat pipe

The maximum heat transport capacity of a heat pipe is influenced by two limitations; one that leads to heat pipe failure and the other that does not. Limitations that result in heat pipe failure are characterized by insufficient liquid flow to the evaporator for a given heat input, thus resulting in dry out of the evaporator section. The limits categorized under heat pipe failure are capillary limit, boiling limit and entrainment limit. However limitations not resulting in heat pipe failure do require that the heat pipe operate at an increased temperature for an increase in heat input. The three limits are viz. viscous limit, wick limit and
