optimal fund performance *Numerical Methods and Optimization in Finance* Manfred Gilli, Dietmar Maringer, Enrico Schumann, 2019-08-16 Computationally intensive tools play an increasingly important role in financial decisions. Many financial problems ranging from asset allocation to risk management and from option pricing to model calibration can be efficiently handled using modern computational techniques. *Numerical Methods and Optimization in Finance* presents such computational techniques with an emphasis on simulation and optimization, particularly so-called heuristics. This book treats quantitative analysis as an essentially computational discipline in which applications are put into software form and tested empirically. This revised edition includes two new chapters: a self-contained tutorial on implementing and using heuristics and an explanation of software used for testing portfolio selection models. Postgraduate students, researchers in programs on quantitative and computational finance, and practitioners in banks and other financial companies can benefit from this second edition of *Numerical Methods and Optimization in Finance*. Market Risk Analysis, Practical Financial Econometrics Carol Alexander, 2008-05-27

Written by leading market risk academic Professor Carol Alexander Practical Financial Econometrics forms part two of the Market Risk Analysis four volume set. It introduces the econometric techniques that are commonly applied to finance with a critical and selective exposition emphasising the areas of econometrics such as GARCH cointegration and copulas that are required for resolving problems in market risk analysis. The book covers material for a one semester graduate course in applied financial econometrics in a very pedagogical fashion as each time a concept is introduced an empirical example is given and whenever possible this is illustrated with an Excel spreadsheet. All together the Market Risk Analysis four volume set illustrates virtually every concept or formula with a practical numerical example or a longer empirical case study. Across all four volumes there are approximately 300 numerical and empirical examples 400 graphs and figures and 30 case studies many of which are contained in interactive Excel spreadsheets available from the accompanying CD ROM. Empirical examples and case studies specific to this volume include Factor analysis with orthogonal regressions and using principal component factors Estimation of symmetric and asymmetric normal and Student t GARCH and EGARCH parameters Normal Student t Gumbel Clayton normal mixture copula densities and simulations from these copulas with application to VaR and portfolio optimization Principal component analysis of yield curves with applications to portfolio immunization and asset liability management Simulation of normal mixture and Markov switching GARCH returns Cointegration based index tracking and pairs trading with error correction and impulse response modelling Markov switching regression models Eviews code
