Body mass index and lifetime healthcare utilization

Christina Hansen Edwards^{1*} , Eline Aas² and Jonas Minet Kinge^{3,2} 

Abstract

Background: Overweight and obesity is a major global public health challenge, and understanding the implications for healthcare systems is essential for policy planning. Past studies have typically found positive associations between obesity and healthcare utilization, but these studies have not taken into consideration that obesity is also associated with early mortality. We examined associations between body mass index (BMI, reported as kg/m²) and healthcare utilization with and without taking BMI-specific survival into consideration.

Methods: We used nationally representative data on 33 882 adults collected between 2002 and 2015. We computed BMI- and age-specific primary and secondary care utilization and multiplied the estimated values with gender-, age-, and BMI-specific probabilities of surviving to each age. Then, we summed the average BMI-specific utilization between 18 and 85 years.

Results: During a survival-adjusted lifetime, males with normal weight (BMI: 18.5–24.9) had, on average, 167 primary care, and 77 secondary care contacts. In comparison, males with overweight (BMI: 25.0–29.9), category I obesity (BMI: 30.0–34.9), and category II/III obesity (BMI ≥35.0) had 11%, 41%, and 102% more primary care, and 14%, 29%, and 78% more secondary care contacts, respectively. Females with normal weight had, on average, 210 primary care contacts and 91 secondary care contacts. Females with overweight, category I obesity, and category II/III obesity had 20%, 34%, and 81% more primary care contacts, and 26%, 16%, and 16% more secondary care contacts, respectively.

Conclusion: The positive association between BMI and healthcare utilization was reduced, but not offset, when BMI-specific survival was taken into consideration. Our findings underpin previous research and suggest that interventions to offset the increasing prevalence of overweight, and especially obesity, are warranted.

Background

Compared with individuals with normal weight, persons with obesity have a greater likelihood of acquiring a range of serious diseases: type-2 diabetes, cardiovascular disease, gallbladder disease, osteoarthritis, hypertension, kidney disease, dyslipidaemia and several cancers [1–3]. Hence, increased healthcare utilization may be needed to manage these conditions. However, in the context of obesity, early mortality may counterbalance increased healthcare utilization due to morbidity. Existing studies that have investigated associations between obesity and healthcare utilization have been done from a non-lifetime perspective, without consideration of early

mortality [4]. As a result, it remains unclear whether healthcare utilization over a cumulative lifetime is higher among persons with obesity, compared with persons with normal weight.

Non-lifetime studies have found associations between obesity and physician encounters [5–11], hospitalizations [7, 8, 12], and hospital outpatient visits [6, 7, 12], and specialist visits [9]. A few studies have not found significant associations between obesity and hospitalization [5, 6, 11] or find differing results depending on age [13], or gender [10]. These previous studies vary in terms of methodology, the number of obesity categories assessed, types of healthcare providers included, and the organization of the healthcare system under study. In addition, several of these studies have focused on a specific sub-population

The current model of parental discipline is as outdated as a rotary phone. Why don't our kids do what we want them to do? Parents often take the blame for misbehavior but this obscures a broader trend in our modern highly connected age: children have less self control than ever. About half of the current generation of children will develop a mood or behavioral disorder or a substance addiction by age eighteen. Contemporary kids need to learn independence and responsibility yet our old ideas of punishments and rewards are preventing this from happening. To stem this growing crisis of self regulation, journalist and parenting expert Katherine Reynolds Lewis articulates what she calls The Apprenticeship Model, a new theory of discipline that centers on learning the art of self control. Blending new scientific research and powerful individual stories of change, Lewis shows that if we trust our children to face consequences they will learn to adapt and moderate their own behavior. She watches as chaotic homes become peaceful, bewildered teachers see progress and her own family grows and evolves in light of these new ideas. You'll recognize your own family in Lewis's sensitive realistic stories and you'll find a path to making everyone in your home more capable, kinder and happier including yourself.

From ravenous ants and temperamental gear to debilitating illness and unpredictable politics, field research can be fraught with challenges and opportunities for mishap. *Disasters in Field Research* is your guide to what can go wrong while conducting fieldwork and what you can do to avoid or minimize the impact of unexpected events. Ice, Dufour and Stevens address the issues confronting both students and professional researchers as they embark on field research. For example, permits may be difficult to obtain or even revoked at the last minute. Cultural differences and misunderstandings can disrupt data collection. Equipment can be held up by customs or fail to work as expected. The authors offer practical advice on preparing for such possibilities while active researchers from a wide array of disciplines relate in brief first person narratives their own encounters with disaster, how they solved or failed to solve the problem, and their recommendations for avoiding similar issues in the future. Each thematic chapter concludes with strategies and suggestions for making the most of your preparations, recovering from missteps and coping with calamity. The result is an
