The rise of Information and Communication Technology ICT in the second half of the 20th century became the dominant force in economics Its rise accelerates in the first 15 years of this century at an astonishing speed The world of ICT right now is in the process of cosmic inflation In the early universe quantum fluctuations in a microscopic inflationary agile region became the seed for growing structures in the universe of galactic nebula galaxies and stars making the universe transparent This phenomenon familiar to physicist and cosmologists happens right now to ICT The current observation is that things of the physical world become intelligent receive IP addresses and connect to the Internet The possibilities to create new ICT based products seem unlimited however sponsors must fuel the inflation Complexity was already an issue when developing software in the early days of ICT Software development is often done in projects that turn out to be exploratory in the sense that they aim at translating human voices uttering requirements into a machine readable language Requirements for the software to be build are usually not known at the beginning the project must uncover them Developing software without knowing the outcome in advance is a complex undertaking Predicting the outcome of software projects by proven methods of civil engineering did not work out well Now new levels of complexity arise with ICT Agile approaches are appropriate for software development however predicting the outcome of projects still is difficult New techniques must manage the growing levels of complexity within ICT Fortunately mathematics has provided these new techniques They rely on transfer functions and Eigenwert theory Its usefulness already has been proven in major search engines of this century However this is not the end of the story This books makes the mathematics of Lean Six Sigma transfer functions available to ICT practitioners It provides the basic theory explained with many examples and even more suggestions how Six Sigma Transfer Functions help

Theories of Probability Louis Narens,2007 Standard probability theory has been an enormously successful contribution to modern science However from many perspectives it is too narrow as a general theory of uncertainty particularly for issues involving subjective uncertainty This first of its kind book is primarily based on qualitative approaches to probabilistic like uncertainty and includes qualitative theories for the standard theory as well as several of its generalizations One of these generalizations produces a belief function composed of two functions a probability function that measures the probabilistic strength of an uncertain event and another function that measures the amount of ambiguity or vagueness of the event Another unique approach of the book is to change the event space from a boolean algebra which is closely linked to classical propositional logic to a different event algebra that is closely linked to a well studied generalization of classical propositional logic known as intuitionistic logic Together these new qualitative theories succeed where the standard probability theory fails by accounting for a number of puzzling empirical findings in the psychology of human probability judgments and decision making
