Task Scheduling for Parallel Systems Oliver Sinnen,2007-05-04 A new model for task scheduling that dramatically improves the efficiency of parallel systems Task scheduling for parallel systems can become a quagmire of heuristics models and methods that have been developed over the past decades The author of this innovative text cuts through the confusion and complexity by presenting a consistent and

comprehensive theoretical framework along with realistic parallel system models. These new models based on an investigation of the concepts and principles underlying task scheduling take into account heterogeneity, contention for communication resources, and the involvement of the processor in communications. For readers who may be new to task scheduling, the first chapters are essential. They serve as an excellent introduction to programming parallel systems and they place task scheduling within the context of the program parallelization process. The author then reviews the basics of graph theory, discussing the major graph models used to represent parallel programs. Next, the author introduces his task scheduling framework. He carefully explains the theoretical background of this framework and provides several examples to enable readers to fully understand how it greatly simplifies and, at the same time, enhances the ability to schedule. The second half of the text examines both basic and advanced scheduling techniques, offering readers a thorough understanding of the principles underlying scheduling algorithms. The final two chapters address communication contention in scheduling and processor involvement in communications. Each chapter features exercises that help readers put their new skills into practice. An extensive bibliography leads to additional information for further research. Finally, the use of figures and examples helps readers better visualize and understand complex concepts and processes. Researchers and students in distributed and parallel computer systems will find that this text dramatically improves their ability to schedule tasks accurately and efficiently.

New Media Users in China II Peng Lan, 2023-09-29. As the second volume of a two-volume set on new media users in China, this book approaches the subject from a micro level, examining the mediatized existence and life of new media users in the digital age and the approaching age of artificial intelligence. To further explore the interaction between people and new media, this volume focuses on the idea of the mediatized survival of new media users. By analyzing user behaviour and practice in mediatized time and space, including selfies, photo retouching, memes, online videos, social media posts, video conferences, and WeChat red packets, the author elucidates the mediatized self-expression embodied in these key phenomena and shows how reality and virtual life converge and interact. The final two chapters discuss drivers of new forms of mediatization surrounding data and cyborgs, exploring the impact of algorithms on people and the outlook for human-machine relationships. This title will be a must-read for scholars, students, and media professionals interested in the topics of internet communication, new media usage, and media and society as a whole.

Multiobjective Scheduling by Genetic Algorithms Tapan P. Bagchi, 2012-12-06. Multiobjective Scheduling by Genetic Algorithms describes methods for developing multiobjective solutions to common production scheduling equations, modeling in the literature as flowshops, job shops, and open shops. The methodology is a metaheuristic one inspired by how nature has evolved a multitude of coexisting species of living beings on earth. Multiobjective flowshops, job shops, and open shops are each highly relevant models in manufacturing, classroom scheduling, or automotive assembly; yet, for want of sound methods, they have remained almost untouched to date. This text shows how methods such as Elitist Nondominated Sorting Genetic Algorithm (ENGA) can find a bevy of Pareto

optimal solutions for them Also it accents the value of hybridizing Gas with both solution generating and solution improvement methods It envisions fundamental research into such methods greatly strengthening the growing reach of metaheuristic methods This book is therefore intended for students of industrial engineering operations research operations management and computer science as well as practitioners It may also assist in the development of efficient shop management software tools for schedulers and production planners who face multiple planning and operating objectives as a matter of course
