Sealing of Boreholes and Underground Excavations in Rock K. Fuenkajorn,J.J. Daemen,2012-12-06 Sealing of boreholes and underground excavations has not received much engineering attention until fairly recently The growing awareness of and sensitivity to environmental concerns of the technical community as well as of the public at large has resulted in an increasing recognition of the fact that these geological penetrations may have an environmental impact The issue of possible contamination resulting from migration along boreholes adits shafts or tunnels unquestionably has been raised most forcefully with in the context of nuclear waste disposal Several nuclear waste disposal programs notably the Civilian and the Defence programs of the US De partment of Energy the US Nuclear Regulatory Commission and the Canadian and Swedish radioactive waste disposal programs have conducted major research efforts aimed at developing adequate seal designs for penet rations in host rock formations for high level nuclear waste repositories While a considerable data base has been gathered over the last two decades or so with regard to the performance of seals most of the information is presented in research reports and widely scattered papers in journals and proceedings of conferences Hence the materials are not readily accessible to potential users such as designers contractors or regulators who are not familiar with nuclear waste disposal programs

Assessment and Remediation of Contaminated Sediments Danny Reible,Tomas Lanczos,2007-01-21 Contaminated sediments pose some of the most difficult site remediation issues Contaminated sediments typically reside in spatially variable and dynamic systems subject to seasonal flow variations and episodic storm events The volume of sediments that must be managed at particular sites often exceeds one million cubic meters dwarfing many contaminated soil sites These sediments are also associated with equally daunting volumes of water and efforts to remove the contamination typically entrains even more water The environmental security of both NATO and partner countries is at risk due to the pervasive nature of sediment contamination of rivers lakes and harbors A NATO Advanced Research Workshop was convened in Bratislava in May 2005 to discuss current approaches to managing contaminated sediments and to identify research necessary to overcome outstanding problems In this text drawn from presentations and discussion of that workshop current approaches to the assessment and remediation of contaminated sediments will be discussed with the emphasis on in situ management Physical chemical and biological approaches for the assessment and remediation of sediments are all addressed Developing regulatory and strategic approaches are highlighted with a special emphasis on the potential for biological remediation for the management of contaminated sediments
