Localization and Mapping of Autonomous Mobile Robots Junzhi Yu,Zhiqiang Cao,Peiyu Guan,Chengpeng Wang,2025-10-31 Localization and mapping play a critical role in the autonomous task execution of mobile robots This book covers the theoretical and technological aspects of robot localization and mapping including visual localization and mapping visual relocalization LiDAR localization and mapping and place recognition It provides the theoretical foundations of robot localization and mapping It employs both traditional methods such as geometry based visual localization and state of the art deep learning techniques that improve robot perception The authors also address LiDAR based localization exploring techniques to improve both efficiency and accuracy when processing dense point clouds Key topics include visual localization using deep features integration of visual solutions under ROS based software architecture and distribution based LiDAR localization This book will be of great interest to students and professionals in the fields of robotics and artificial intelligence It will also be an excellent reference for engineers and technicians involved in the development of robot localization

Simultaneous Localization and Mapping Zhan Wang,Gamini Dissanayake,Shoudong Huang,2011 Simultaneous localization and mapping SLAM is a process where an autonomous vehicle builds a map of an unknown environment while concurrently generating an estimate for its location This book is concerned with computationally efficient solutions to the large scale SLAM problems using exactly sparse Extended Information Filters EIF The invaluable book also provides a comprehensive theoretical analysis of the properties of the information matrix in EIF based algorithms for SLAM Three exactly sparse information filters for SLAM are described in detail together with two efficient and exact methods for

recovering the state vector and the covariance matrix Proposed algorithms are extensively evaluated both in simulation and through experiments

Castellanos,1999 *Semantic Mapping in ROS* Xavier Gallart Del Burgo,2013 ANGL S In the last few years robots are becoming more popular in our daily lives We can see them guiding people in museums helping surgeons in hospitals and autonomously cleaning houses With the aim of enabling robots to cooperate with humans and to perform human like tasks we need to provide them with the capability of understanding human environments and representing the extracted knowledge in such a way that humans can interpret Semantic mapping can be defined as the process of building a representation of the environment incorporating semantic knowledge obtained from sensory information Semantic properties can be extracted from various sources such as objects topology of the environment size and shape of rooms and room appearance This thesis proposes an implementation of semantic mapping for mobile robots which is integrated in a framework called Robot Operating System ROS The system extracts spatial properties like rooms objects and topological information and combines

them with common sense knowledge into a probabilistic framework which is capable of inferring room categories The system is tested in simulations and in real world scenarios and the results show how the system explores an unknown environment creates an accurate map detects objects infers room categories and represents the results in a map where each room is labelled according to its functionality

ATLAS Michael Carsten Bosse,2004 This thesis describes a scalable robotic navigation system that builds a map of the robot's environment on the fly This problem is also known as Simultaneous Localization and Mapping SLAM The SLAM problem has as inputs the control of the robot's motion and sensor measurements to features in the environment The desired output is the path traversed by the robot localization and a representation of the sensed environment mapping The principal contribution of this thesis is the introduction of a framework termed Atlas that alleviates the computational restrictions of previous approaches to SLAM when mapping extended environments The Atlas framework partitions the SLAM problem into a graph of submaps each with its own coordinate system Furthermore the framework facilitates the modularity of sensors map representations and local navigation algorithms by encapsulating the implementation specific algorithms into an abstracted module The challenge of loop closing is handled with a module that matches submaps and a verification procedure that trades latency in loop closing with a lower chance of incorrect loop detections inherent with symmetric environments The framework is demonstrated with several datasets that map large indoor and urban outdoor environments using a variety of sensors a laser scanner sonar rangefinders and omni directional video

FastSLAM Michael Montemerlo,Sebastian Thrun,2010-11-18 This monograph describes a new family of algorithms for the simultaneous localization and mapping SLAM problem in robotics called FastSLAM The FastSLAM type algorithms have enabled robots to acquire maps of unprecedented size and accuracy in a number of robot application domains and have been successfully applied in different dynamic environments including a solution to the problem of people tracking

Simultaneous Localization and Mapping (SLAM) with Kalman Filtering Grigor Badalyan,2016 Robot self localization and mapping or as it is termed Simultaneous Localization and Mapping SLAM is a common use case in robot functions As a complex system that integrates analog sensor based data acquisition and processing SLAM has some accuracy limitations based on the sensors accuracy and environmental conditions that may alter or disrupt sensing 1 The objective of this project is to demonstrate the benefits of Kalman Filtering on processing of the disruptive or noisy data for the goal of robot localization and mapping In short Kalman Filter takes the mathematical model of the process and the measurements It predicts the future state acquires and adjusts the measurements updates prediction of next states based on the success or errors of the prior prediction Kalman Filtering is used in broad spectrum of applications including robotics financial medical and any other field where there is a need for improved accuracy of measurements or noise reduction In our application the accuracy of the mapping and localization is greatly dependent on the environmental conditions that may affect the accuracy of the sensors mechanical and electrical parameters of the hardware and the complexity and dynamics of the mathematical model of the system In the interest of the scope of this project for efficiency and maximum rewards vs efforts we will ignore the environmental variables and focus on the parameters of the process and noisy measurement system The robot that is used for the project is equipped with laser range scanner compass and motor encoders The motion model of the robot is based on differential drive with dual motors one on each side The laser range scanner and the other sensors are independent and when fused with Kalman filtering algorithm will dramatically reduce the inaccuracies of the measurements
