

Exercise 1: The importance of cells

- All organisms are made of cells
 - o Many organisms are single-celled
 - o Even for multicellular organisms, the cells are the basic unit of structure and function
- The cells are the smallest collection of material that can live
- All cells are defined by their distinct boundaries called

Exercise 2: The study of cells, microscopes and microorganisms and the ways of magnification

- The discovery and study of cells progressed with the invention of microscopes in 1590 and their improvement in the 17th century
- An **light microscope** (LM), enables light waves through the specimen and then through glass lenses
 - o The lenses collect light such that the image is magnified and the eye is able to view it better
- Microscopes vary in magnification and resolving power
 - o **Magnification** is the amount an object is magnified in the final eye
 - o **Resolving power** is a measure of image clarity
 - o It is the minimum size between two points can be separated and still be distinguished as two separate points
 - o Resolution is limited by the shortest wavelength of the radiation used for imaging
- The minimum wavelength of light microscopes allow LM magnification being the end of a **visible spectrum**
- Light microscopes can magnify effectively to about 1,000 times the size of the actual specimen
 - o At higher magnifications, the resolution
- Structures observed in the LM including those withered distinct and unglazed particles and organisms to be studied is labelled as they appear to be
- Since a light microscope can observe individual cells, it cannot resolve much of the internal structure, especially in organelles
- To observe smaller structures, we use an **electron microscope (EM)**, which focuses a beam of electrons through the specimen or onto the surface
 - o Because electrons is indirectly related to wavelength, used electron microscopes reveal **atomic level** more physical separations than visible light have been resolution
 - o Consequently, the resolution of a typical EM could reach 0.05 micrometers (nm), but the practical limit is about 0.1 nm
- **Transmission electron microscope (TEM)** was used mainly to study the structure of organelles of cells
 - o A EM can use an electron beam through a thin section of the specimen
 - o The image is focused and magnified by electromagnets
