DERAKANE® 510 C-350 Epoxy Vinyl Ester Resin

DERAKANE 510C-350 resin is a brominated vinyl ester resin that offers a high degree of fire retardance⁽¹⁾ while providing the excellent chemical resistance and toughness typical of DERAKANE resins. Optimum fire retardance is achieved when antimony compounds are added to the resin. DERAKANE 510 C-350 resin provides resistance to a wide range of acids, alkalis, bleaches and organic compounds for use in many chemical processing industry applications.

DERAKANE 510C-350 resin contains only 35 percent styrene, resulting in reduced styrene emissions.

(1) The fire retardancy and flame spread data were obtained from controlled and/or small scale bench tests and the results apply specifically to the specimens tested, in the manner tested. They are not necessarily predictive of product performance in a real fire situation. DERAKANE resins are organic materials and the fabricated products constructed from them will burn under the right conditions of heat and oxygen supply. This numerical flame spread rating is not intended to reflect hazards presented by this or any other material under actual fire conditions.

APPLICATIONS AND USE

Equipment fabricated with DERAKANE 510C-350 resin resists mechanical and chemical damage which enables it to be used in various caustic environments such as sodium hypochlorite, chlorine dioxide and alkaline hydrogen peroxide. It is also suitable for equipment specified to handle mixtures of air and hot gases, building panels, and flooring compounds where a degree of fire retardance is required. It is also recommended for use in FRP ductwork, stacks and stack-liner applications.

DERAKANE 510C-350 resin is designed for ease of fabrication using hand lay-up, spray-up, filament winding, compression molding, resin transfer molding techniques and pultrusion.

Laminates made with DERAKANE 510 C-350 resin have been certified to meet ASTM E-84 flame spread "Class 2" rating (less than 75). With the use of antimony synergists, Class 1 ratings can be achieved.⁽²⁾

Figueiredo, Carlos A. Bernardo, R.T.K. Baker, K.J. Hüttinger, 2013-03-14 Conventional synthetic materials like metals ceramics or glass are usually isotropic substances and their suitability for structural applications is achieved by morphological design and combination in the macroscopic scale However in modern engineering this is often not acceptable As an alternative the use of non homogeneous anisotropic materials with significant stiffness and strength only in the directions these mechanical properties are really needed can lead to enormous material and weight savings This is the case of multiphase systems called composite materials In these composites different material parts are added and arranged geometrically under clearly designed and controlled conditions Usually a structure of fibers provides strength and stiffness and a matrix holds them together whilst providing the geometric form Carbon fibers are among the high performance fibers employed in these advanced structural composites which are profoundly changing many of today's high technology industries New research and development challenges in this area include upgrading the manufacturing process of fibers and composites in order to improve characteristics and reduce costs and modifying the interfacial properties between fibers and matrix to guarantee better mechanical properties The interdisciplinary nature of this new frontier is obvious involving chemistry materials science chemical and mechanical engineering Other topics which more often are treated separately are also important for the understanding of the processes of fiber production Carbon filaments is one such topic as the study of their mechanisms of
