Metaheuristics for Finding Multiple Solutions Mike Preuss, Michael G. Epitropakis, Xiaodong Li, Jonathan E. Fieldsend, 2021-10-22 This book presents the latest trends and developments in multimodal optimization and niching techniques Most existing optimization methods are designed for locating a single global solution However in real world settings many problems are multimodal by nature i e multiple satisfactory solutions exist It may be desirable to locate several such solutions before deciding which one to use Multimodal optimization has been the subject of intense study in the field of population based meta heuristic algorithms e g evolutionary algorithms EAs for the past few decades These multimodal optimization techniques are commonly referred to as niching methods because of the nature inspired niching effect that is induced to the solution population targeting at multiple optima Many niching methods have been developed in the EA community Some classic examples include crowding fitness sharing clearing derating restricted tournament selection speciation etc Nevertheless applying these niching methods to real world multimodal problems often encounters significant challenges To facilitate the advance of niching methods in facing these challenges this edited book highlights the latest developments in niching methods The included chapters touch on algorithmic improvements and developments representation and visualization issues as well as new research directions such as preference incorporation in decision making and new application areas This edited book is a first of this kind specifically on the topic of niching techniques This book will serve as a valuable reference book both for researchers and practitioners Although chapters are written in a mutually independent way Chapter 1 will help novice readers get an overview of the field It describes the development of the field and its current state and provides a comparative analysis of the IEEE CEC and ACM GECCO niching competitions of recent years followed by a collection of open research questions and possible research directions that may be tackled in the future

Software Composition Thomas Gschwind, Uwe Assmann, Oscar Nierstrasz, 2005-09-19 Component based software development is the next step after object oriented programming that promises to reduce complexity and improve reusability. These advantages have also been identified by the industry and consequently over the past years a large number of component based techniques and processes have been adopted in many of these organizations. A visible result of this is the number of component models that have been developed and standardized. These models define how individual software components interact with each other and simplify the design process of software systems by allowing developers to choose from previously existing components. The development of component models is a first step in the right direction but there are many challenges that cannot be solved by the development of a new component model alone. Such challenges are the adaptation of components and their development and verification. Software Composition is the premiere workshop to advance the research in component based software engineering and its related fields. SC 2005 was the fourth workshop in this series. As in previous years SC 2005 was organized as an event co-located with the ETAPS conference. This year's program consisted of a keynote on the revival of dynamic languages given by Prof. Oscar Nierstrasz and 13 technical paper presentations: 9 full and 4 short papers. The technical papers were carefully selected from a total of 41 submitted papers. Each paper was thoroughly peer reviewed by at least three members of the program committee and consensus on acceptance was achieved by means of an electronic PC discussion. This LNCS volume contains the revised versions of the papers presented at SC 2005.

Artificial Life Seiki Akama, 2024-11-29 This book provides some resources of Artificial Life. Artificial Life (ALife or A-Life) is the research area which simulates a life computationally. It involves several approaches to living systems in artificial manners. It was recognized as a scientific field in the 1980's. Artificial Life is related to many scientific fields including biology and computer science and its history is old. In fact, the earlier works have been done by people like Turing and von Neumann. Fields like neural networks, evolutionary computation, and cellular automata constitute the foundations for Artificial Life. The so-called wetware is an approach in more biology-oriented which is known that there are some Artificial Life Systems at present. It is expected to see further progress of this exciting field. The materials include history, philosophy, related areas, recent developments, etc. Starting from the overview, the authors give an exposition of basic subjects like cellular automata, neural networks, evolutionary computation, and wetware. The authors also introduce some examples of Artificial Life Systems like Boids, Tierra, and Open Warm. The book is intended for those like experts and students who wish to get involved in the field as a monograph or a textbook for the subject. It is also useful for beginners. But the authors assume that the reader has mastered the material ordinarily covered in AI and mathematics.

Morazán, 2023-12-18 This textbook introduces formal languages and automata theory for upper level undergraduate or beginning graduate students While it contains the traditional mathematical development usually employed in computational theory courses it is also quite different from many of them Machines grammars and algorithms developed as

part of a constructive proof are intended to be rendered as programs The book is divided into four parts that build on each other Part I reviews fundamental concepts It introduces programming in FSM and reviews program design In addition it reviews essential mathematical background on sets relations and reasoning about infinite sets Part II starts the study of formal languages and automata theory in earnest with regular languages It first introduces regular expressions and shows how they are used to write programs that generate words in a regular language Given that regular expressions generate words it is only natural to ask how a machine can recognize words in a regular language This leads to the study of deterministic and nondeterministic finite state machines Part III starts the exploration of languages that are not regular with context free languages It begins with context free grammars and pushdown automata to generate and recognize context free languages and it ends with a discussion of deterministic pushdown automata and illustrates why these automata are fundamentally different from nondeterministic pushdown automata Part IV eventually explores languages that are not context free known as context sensitive languages It starts by discussing the most powerful automaton known to mankind the Turing machine It then moves to grammars for context sensitive languages and their equivalence with Turing machines is explored The book ends with a brief chapter introducing complexity theory and explores the question of determining if a solution to a problem is practical

Mathematical Theory and Computational Practice Klaus Ambos-Spies, Benedikt Löwe, Wolfgang Merkle, 2009-07-15 This book constitutes the proceedings of the 5th Conference on Computability in Europe CiE 2009 held in Heidelberg Germany during July 19-24 2009 The 34 papers presented together with 17 invited lectures were carefully reviewed and selected from 100 submissions The aims of the conference is to advance our theoretical understanding of what can and cannot be computed by any means of computation It is the largest international meeting focused on computability theoretic issues

Theory of Computation K.R.
