Meyer, André Schiper, 2006-07-31 Modern civilization relies on a functioning information infrastructure As a result dependability has become a central issue in all disciplines of systems engineering and software architecture Theories methods and tools that help to master the problems encountered in the design process and the management of operations are therefore of utmost importance for the future of information and communication technology The present volume documents the results of a research program on Dependable Information and Communication Systems DICS The members of the project met in two workshops organized by the Hasler Foundation This state of the art survey contains 3 overview articles identifying major issues of dependability and presenting the latest solutions as well as 10 carefully selected and revised papers depicting the research results originating from those workshops The first workshop took place in Munchenwiler Switzerland in March 2004 and the second workshop which marked the conclusion of the projects in Lwenberg Switzerland in October 2005 The papers are organized in topical sections on surveys dependable software dependable computing and dependable networks *Reliable Software Technologies - Ada-Europe 2001* Dirk Craeynest, Alfred Strohmeier, 2003-06-29 The Sixth International Conference on Reliable Software Technologies Ada Europe 2001 took place in Leuven Belgium May 14 18 2001 It was sponsored by Ada Europe the European federation of national Ada societies in cooperation with ACM SIGAda and it was organized by members of the K U Leuven and Ada Belgium This was the 21st consecutive year of Ada Europe conferences and the sixth year of the conference focusing on the area of reliable software technologies The use of software components in embedded systems is almost ubiquitous planes fly by wire train signalling systems are now computer based mobile phones are digital devices and biological chemical and manufacturing plants are controlled by software to name only a few examples Also other non embedded mission critical systems depend more and more upon software For these products and processes reliability is a key success factor and often a safety critical hard requirement It is well known and has often been experienced that quality cannot be added to software as a mere afterthought This also holds for reliability Moreover the reliability of a system is not due to and cannot be built upon a single technology A wide range of approaches is needed the most difficult issue being their purposeful integration Goals of reliability must be precisely defined and included in the requirements the development process must be controlled to achieve these goals and sound development methods must be used to fulfill these non functional requirements
