Progress in Nano-Electro Optics III Motoichi Ohtsu, 2005-12-17 Near eld optical recording is a promising way to realize a recording density 2 of over 1 Tb in In this chapter we focused on the near eld optical head which is a key device for near eld optical recording First we explained the technical issues regarding the near eld optical head and introduced some solutions to these issues We focused on a highly e cient near eld optical head that uses a wedge shaped metallic plate and described its optical pr erties based on a simulation using a nite di erence time domain method The simulation results con rmed that a strong optical near eld is generated at the apex of the metallic plate when a plasmon is excited in the metallic plate When a TbFeCo recording medium was placed 10 nm from the ne eld optical head the size of the optical spot was 30 nm which corresponds 2 to an areal recording density of approximately 1 Tb in The e ciency was 20% if we assume that the incident beam was a Gaussian beam with a full width at half maximum of 1 m Furthermore we discussed an optical head using two metallic plates We con rmed through our simulation that a highly localized optical near eld was generated at the gap when the plasmon was excited in the metallic plates The distribution was 5 nm by 5 nm when the two apices were separated by 5 nm
