Natural rubber (NR) based nanocomposites containing a constant amount (50 phr) of standard furnace carbon black and carbon nanotube (CNT) at a concentration from 1 to 5 phr have been prepared. Their dielectric (dielectric permittivity and dielectric loss) and microwave properties (coefficients of absorption and reflection of the electromagnetic waves and electromagnetic interference shielding effectiveness) have been investigated in the 1–12 GHz frequency range. The results achieved allow recommending CNTs as second filler for NR based composites to afford specific absorbing properties.

Keywords: Natural rubber composites, Carbon nanotubes, Dielectric and microwave properties

Introduction

Since the documented discovery of carbon nanotubes (CNTs) in 1991 by Iijima¹ and the realisation of their unique² physical properties, including mechanical, thermal and electrical, many investigators have endeavoured to produce advanced CNT composite materials that exhibit one or more of these properties. For example, CNT are quite effective as a conductive filler of polymers, compared to traditional carbon black micro-particles, primarily due to their high aspect ratios. Recently, the electrical percolation threshold has been reported to be at 0.0025 wt-% of CNT and conductivity at 2.5 S m^{-1} at 1.0 wt-% of CNT in epoxy matrices.³

Owing to their fibrous shape with extremely large aspect ratio, CNT may, at a very low concentration, yield composites of low resistivity, high permittivity and frequency dispersion.⁴ It is well known that the nanosized particles usually exhibit properties different from those of micro-sized particles of the same composition, which is the primary reason for the great attention currently paid to the radio and microwave frequency performance of CNT composites. A number of novel CNT features have been reported in the literature.^{5–11} These results demonstrate

the possibility to design CNT composites with electrical/dielectric properties, which are more diverse than those obtainable with other carbon fillers.

There are numerous investigations on nanocomposites based on elastomeric matrices and CNTs as filler, although the researchers' attention has been directed mainly to the reinforcement of polymer matrices. The influence of this unique filler upon the dielectric and microwave properties of the elastomeric composites has been scarcely studied. Lately, there have been articles suggesting possible applications of such nanocomposites in microwave absorbers for solving problems of electromagnetic interference (EMI) and electromagnetic compatibility.^{12–20} The polymer matrices used in these cases are usually epoxy resin, acrylonitrile-butadiene rubber, styrene-butadiene rubber, silicone rubber and polyurethane rubber. Only in the last years have appeared reports on the investigations on natural rubber (NR) based nanocomposites filled with CNTs.^{21–24}

The price of CNTs is still significantly higher than that of standard furnace carbon black. In this context, the aim of this study is to determine whether the addition of small quantities (1–5 phr) of CNT in addition to a standard significantly greater than the amount of active furnace carbon black (50 phr) can be used as a way to modify and improve the dielectric (dielectric permittivity, dielectric loss) and microwave properties [coefficient of reflection, coefficient of attenuation and EMI shielding effectiveness (SE)] of NR based composites in the high frequency range (1–12 GHz). Data for such a study on the reported combination of fillers have not been found in the literature.
