Digital Image Processing With Matlab Gonzalez:

Digital Image Processing Rafael C. Gonzalez, Richard Eugene Woods, 2018 Introduce your students to image processing with the industry's most prized text For 40 years Image Processing has been the foundational text for the study of digital image processing The book is suited for students at the college senior and first year graduate level with prior background in mathematical analysis vectors matrices probability statistics linear systems and computer programming As in all earlier editions the focus of this edition of the book is on fundamentals The 4th Edition which celebrates the book's 40th anniversary is based on an extensive survey of faculty students and independent readers in 150 institutions from 30 countries Their feedback led to expanded or new coverage of topics such as deep learning and deep neural networks including convolutional neural nets the scale invariant feature transform SIFT maximally stable extremal regions MSERs graph cuts k means clustering and superpixels active contours snakes and level sets and exact histogram matching Major improvements were made in reorganizing the material on image transforms into a more cohesive presentation and in the discussion of spatial kernels and spatial filtering Major revisions and additions were made to examples and homework exercises throughout the book For the first time we added MATLAB projects at the end of every chapter and compiled support packages for you and your teacher containing solutions image databases and sample code The support materials for this title can be found at www.ImageProcessingPlace.com

Digital Image Processing Using MATLAB Rafael C. Gonzalez, Richard Eugene Woods, Steven L. Eddins, 2004 Solutions to problems in the field of digital image processing generally require extensive experimental work involving software simulation and testing with large sets of sample images Although algorithm development typically is based on theoretical underpinnings the actual implementation of these algorithms almost always requires parameter estimation and frequently algorithm revision and comparison of candidate solutions Thus selection of a flexible comprehensive and well documented software development environment is a key factor that has important implications in the cost development time and portability of image processing solutions In spite of its importance surprisingly little has been written on this aspect of the field in the form of textbook material dealing with both theoretical principles and software implementation of digital image processing concepts This book was written for just this purpose Its main objective is to provide a foundation for implementing image processing algorithms using modern software tools A complementary objective was to prepare a book that is self contained and easily readable by individuals with a basic background in digital image processing mathematical analysis and computer programming all at a level typical of that found in a junior senior curriculum in a technical discipline Rudimentary knowledge of MATLAB also is desirable To achieve these objectives we felt that two key ingredients were needed The first was to select image processing material that is representative of material covered in a formal course of instruction in this field The second was to select software tools that are well supported and documented and which have a wide range of applications in the real world To meet the first objective most of the theoretical concepts in the following

chapters were selected from Digital Image Processing by Gonzalez and Woods which has been the choice introductory textbook used by educators all over the world for over two decades. The software tools selected are from the MATLAB Image Processing Toolbox (IPT) which similarly occupies a position of eminence in both education and industrial applications. A basic strategy followed in the preparation of the book was to provide a seamless integration of well established theoretical concepts and their implementation using state of the art software tools. The book is organized along the same lines as Digital Image Processing. In this way the reader has easy access to a more detailed treatment of all the image processing concepts discussed here as well as an up to date set of references for further reading. Following this approach made it possible to present theoretical material in a succinct manner and thus we were able to maintain a focus on the software implementation aspects of image processing problem solutions. Because it works in the MATLAB computing environment the Image Processing Toolbox offers some significant advantages not only in the breadth of its computational tools but also because it is supported under most operating systems in use today. A unique feature of this book is its emphasis on showing how to develop new code to enhance existing MATLAB and IPT functionality. This is an important feature in an area such as image processing which as noted earlier is characterized by the need for extensive algorithm development and experimental work. After an introduction to the fundamentals of MATLAB functions and programming the book proceeds to address the mainstream areas of image processing. The major areas covered include intensity transformations linear and nonlinear spatial filtering filtering in the frequency domain image restoration and registration color image processing wavelets image data compression morphological image processing image segmentation region and boundary representation and description and object recognition. This material is complemented by numerous illustrations of how to solve image processing problems using MATLAB and IPT functions. In cases where a function did not exist a new function was written and documented as part of the instructional focus of the book. Over 60 new functions are included in the following chapters. These functions increase the scope of IPT by approximately 35 percent and also serve the important purpose of further illustrating how to implement new image processing software solutions. The material is presented in textbook format not as a software manual. Although the book is self contained we have established a companion Web site (see Section 1.5) designed to provide support in a number of areas. For students following a formal course of study or individuals embarked on a program of self study the site contains tutorials and reviews on background material as well as projects and image databases including all images in the book. For instructors the site contains classroom presentation materials that include PowerPoint slides of all the images and graphics used in the book. Individuals already familiar with image processing and IPT fundamentals will find the site a useful place for up to date references new implementation techniques and a host of other support material not easily found elsewhere. All purchasers of the book are eligible to download executable files of all the new functions developed in the text. As is true of most writing efforts of this nature progress continues after work on the manuscript stops. For this reason we devoted

significant effort to the selection of material that we believe is fundamental and whose value is likely to remain applicable in a rapidly evolving body of knowledge We trust that readers of the book will benefit from this effort and thus find the material timely and useful in their work
