Noah's Ravens James O. Farlow, 2018-10-08 How can the tracks of dinosaurs best be interpreted and used to reconstruct them In many Mesozoic sedimentary rock formations fossilized footprints of bipedal three toed tridactyl dinosaurs are preserved in huge numbers often with few or no skeletons Such tracks sometimes provide the only clues to the former presence of dinosaurs but their interpretation can be challenging How different in size and shape can footprints be and yet have been made by the same kind of dinosaur How similar can they be and yet have been made by different kinds of dinosaurs To what extent can tridactyl dinosaur footprints serve as proxies for the biodiversity of their makers Profusely illustrated and meticulously researched Noah s Ravens quantitatively explores a variety of approaches to interpreting the tracks carefully examining within species and across species variability in foot and footprint shape in nonavian dinosaurs and their close living relatives The results help decipher one of the world s most important assemblages of fossil dinosaur tracks found in sedimentary rocks deposited in ancient rift valleys of eastern North America Those often beautifully preserved tracks were among the first studied by paleontologists and they were initially interpreted as having been made by big birds one of which was jokingly identified as Noah s legendary raven

Acrocanthosaurus Inside and Out Kenneth Carpenter, 2016-09-22 How can paleontologists know what a living dinosaur was like more than a hundred million years ago particularly when only partial skeletons remain Focusing on one large carnivorous dinosaur Acrocanthosaurus high spined lizard paleontologist Kenneth Carpenter explains the process pairing scholarly findings with more than 75 color illustrations to reconstruct Acro before readers eyes In Acrocanthosaurus Inside and Out he offers the most complete portrait possible of this fascinating dinosaur s appearance biology and behavior Acrocanthosaurus similar in size to its later cousin Tyrannosaurus rex but studded with large spines roamed what is now the south central United States 110 to 115 million years ago during the Early Cretaceous Carpenter worked on the most complete of the Acrocanthosaurus skeletons nicknamed Fran that has been found Here he describes the techniques that tell us about Acro s biological makeup movements and habits Studies of joints reveal the range of possible motion while bumps ridges and scars on the bones show where muscles ligaments and tendons attached CT scans allow us to peer into the braincase while microscopes afford a cross

sectional view of bones These findings in turn offer an idea of how Acro stalked and ate its prey Scientific evidence beyond the fossils provides avenues for further inquiry What does the sedimentary rock encasing Fran's bones tell us about Acro's environment What does our knowledge of Acro's distant relatives such as crocodilians and birds imply about its heart and other soft tissues Can our understanding of other animals explain Acro's huge spines Carpenter distills all this information into a clear accessible engaging account that will appeal to general readers and scholars alike As the first book length work on Acrocanthosaurus this volume introduces a prehistoric giant that once stalked Texas and Oklahoma and offers a rare firsthand glimpse into the trials and triumphs of paleontology

Montellano-Ballesteros, Sergio R.S. Cevallos-Ferriz, Sara A. Quiroz-Barroso, 2006-07-15 During the last few years the number of contributions to the Paleontology of Mexico has increased considerably Paleontological work in Mexico has been focused on providing important information for petroleum exploration and specific studies dealing with pollen foraminifera radiolaria dinoflagellates rudists and ammonites Often these reports were published only in local or regional journals and therefore not available to the scientific community at large The purpose of this book is to offer an updated review of the fossil groups from Mexico providing their significance to the stratigraphy tectonics sedimentology evolution and paleontology of Mexico whose study has proved to be relevant in stratigraphy tectonics sedimentology and evolution The fossil record of Mexico ranges from Precambrian to Pleistocene Almost every Mexican State has reported fossil localities with ongoing studies and potential for the discovery of new localities Even those localities that have been studied since the eighteen century such as the early Cretaceous San Juan Raya have recently reported new fossil groups Unfortunately much of the fossil reports from Mexico have been published in Spanish from local journals which represent a language barrier to the international community There is little doubt that the paleontological history of Mexico deserves to be known in other countries By making this book available to the international scientific community we hope that interest in the fossil record of Mexico will grow
