Embedded Systems Handbook 2-Volume Set

Richard Zurawski, 2018-10-08 During the past few years there has been an dramatic upsurge in research and development implementations of new technologies and deployments of actual solutions and technologies in the diverse application areas of embedded systems These areas include automotive electronics industrial automated systems and building automation and control Comprising 48 chapters and the contributions of 74 leading experts from industry and academia the Embedded Systems Handbook Second Edition presents a comprehensive view of embedded systems their design verification networking and applications The contributors directly involved in the creation and evolution of the ideas and technologies presented offer tutorials research surveys and technology overviews exploring new developments deployments and trends To accommodate the tremendous growth in the field the handbook is now divided into two volumes New in This Edition Processors for embedded systems Processor centric architecture description languages Networked embedded systems in the automotive and industrial automation fields Wireless embedded systems Embedded Systems Design and Verification Volume I of the handbook is divided into three sections It begins with a brief introduction to embedded systems design and verification The book then provides a comprehensive overview of embedded processors and various aspects of system on chip and FPGA as well as solutions to design challenges The final section explores power aware embedded computing design issues specific to secure embedded systems and web services for embedded devices Networked Embedded Systems Volume

It focuses on selected application areas of networked embedded systems. It covers automotive, field industrial automation, building automation, and wireless sensor networks. This volume highlights implementations in fast evolving areas which have not received proper coverage in other publications. Reflecting the unique functional requirements of different application areas, the contributors discuss inter node communication aspects in the context of specific applications of networked embedded systems.

Design and Verification of Bus Bridge from Ocp to AHB Ranganathan Sundaram, 2012. Protocols are commonly used to connect IP blocks on structured SoCs. Generally, Protocol is the back bone of the SoC and its failure usually leads to a non functional chip. In present market various types of standard protocols are available and are used in SoC which requires a bridge to pass the information from one type of protocol to other type of protocol safely and without any data loss. OCP and AMBA AHB protocol are commonly used protocols. In this work the bus bridge has been designed to interface these protocols which plays a vital role in SoC application such as it may lead to application failure if it doesn't work properly. Initially OCP and AHB protocols are modeled separately using VHDL and are simulated. Basically Bus Bridge should convert command and data of OCP formats to acceptable AHB formats. This conversion does not ensure proper communication unless the timings of each protocol were met. Hence the interconnecting Bus Bridge wrapper between Core Centric Protocol OCP and Bus Centric Protocol AHB was designed with proper timing delay. Also the PSL assertions are written in order to verify the behavior of protocols.

Design Verification and Performance Analysis of Serial AXI Links in Broadcom System-on-Chip Simran Kaur Sarai, 2014. Design verification is an essential step in the development of any product. Also referred to as qualification testing, design verification ensures that the product as designed is the same as the product as intended. In this project design verification and performance analysis of Thin Advanced Extensible Interface Links T AXI is conducted on a Broadcom's SoC System on Chip. T AXI is a Broadcom's proprietary bus that interfaces all the subsystems on the System onchip SoC to the system memory. Test cases are developed to verify the functionality of the T AXI and performance verification is implemented using scenarios derived from real world examples. A Field Programmable Gate Array FPGA is used to emulate the SoC design and C programming is used to write the test cases. The test results verify the T AXI functionality and the performance analysis supports the theoretical calculations.
