Chapter 1 (Introduction)

Exercise 1.1

Since $f(\cdot)$ is convex we have that

$$f(\lambda x + (1 - \lambda)y) \leq \lambda f(x) + (1 - \lambda)f(y) . \quad (1)$$

Since $f(\cdot)$ is concave we also have that

$$f(\lambda x + (1 - \lambda)y) \geq \lambda f(x) + (1 - \lambda)f(y) . \quad (2)$$

Combining these two expressions we have that f must satisfy each with equality or

$$f(\lambda x + (1 - \lambda)y) = \lambda f(x) + (1 - \lambda)f(y) . \quad (3)$$

This implies that f must be linear and the expression given in the book holds.

Linear Optimization and Extensions Dimitris Alevras, Manfred W. Padberg, 2001 Books on a technical topic like linear programming without exercises ignore the principal beneficiary of the endeavor of writing a book namely the student who learns best by doing course Books with exercises if they are challenging or at least to some extent so exercises of need a solutions manual so that students can have recourse to it when they need it Here we give solutions to all exercises and case studies of M Padberg s Linear Optimization and Extensions second edition Springer Verlag Berlin 1999 In addition we have included several new exercises and taken the opportunity to correct and change some of the exercises of the book Here and in the main text of the present volume the terms book text etc designate the second edition of Padberg s LPbook and the page and formula references refer to that edition as well All new and changed exercises are marked by a star in this volume The changes that we have made in the original exercises are inconsequential for the main part of the original text where several of the exercises especially in Chapter 9 are used on several occasions in the proof arguments None of the exercises that are used in the estimations etc have been changed

Optimization Igor Griva,Stephen G. Nash,Ariela Sofer,2009-01-01 Provides an introduction to the applications theory and algorithms of linear and nonlinear optimization The emphasis is on practical aspects discussing modern algorithms as well as the influence of theory on the interpretation of solutions or on the design of software The book includes several examples of realistic optimization models that address important applications The succinct style of this second edition is punctuated with numerous real life examples and exercises and the authors include accessible explanations of topics that are not often mentioned in textbooks such as duality in nonlinear optimization primal dual methods for nonlinear optimization filter methods and applications such as support vector machines The book is designed to be flexible It has a modular structure and uses consistent notation and terminology throughout It can be used in many different ways in many different courses and at many different levels of sophistication **Student's Solutions Manual** Brian David Camp,2002 **Linear Optimization and Approximation** K. Glashoff,S.-A. Gustafson,2012-12-06 A linear optimization problem is the task of minimizing a linear real valued function of finitely many variables subject to linear constraints in general there may be infinitely many constraints This book is devoted to such problems Their mathematical properties are investigated and algorithms for their computational solution are presented Applications are discussed in detail Linear optimization problems are encountered in many areas of applications They have therefore been subject to mathematical analysis for a long time We mention here only two classical topics from this area the so called uniform approximation of functions which was used as a mathematical tool by Chebyshev in 1853 when he set out to design a crane and the theory of systems of linear inequalities which has already been studied by Fourier in 1823 We will not treat the historical development of the theory of linear optimization in detail However we point out that the decisive break through occurred in the middle of this century It was urged on by the need to solve complicated decision problems where the optimal deployment of military and civilian resources had to be determined The availability of electronic computers also played an important role The principal computational scheme for the solution of linear optimization problems the simplex algorithm was established by Dantzig about 1950 In addition the fundamental theorems on such problems were rapidly developed based on earlier published results on the properties of systems of linear inequalities
