Hypervisor Introspection: a Technique for Evading Passive Virtual Machine Monitoring, 2015 *The Virtualization Cookbook for IBM Z Volume 1: IBM z/VM 7.2* Lydia Parziale, Edi Lopes Alves, Vic Cross, Paul Novak, Mauro Cesar de Souza, IBM Redbooks, 2024-11-11. This IBM Redbooks publication is volume one of five in a series of books entitled *The Virtualization Cookbook for IBM Z*. The series includes the following volumes: *The Virtualization Cookbook for IBM z Systems Volume 1: IBM z VM 7.2* SG24-8147, *The Virtualization Cookbook for IBM Z Volume 2: Red Hat Enterprise Linux 8.2 Servers* SG24-8303, *The Virtualization Cookbook for IBM z Systems Volume 3: SUSE Linux Enterprise Server 12* SG24-8890, *The Virtualization Cookbook for IBM z Systems Volume 4: Ubuntu Server 16.04* SG24-8354, and *Virtualization Cookbook for IBM Z Volume 5: KVM* SG24-8463. It is recommended that you start with Volume 1 of this series because the IBM z VM hypervisor is the foundation or base layer for installing Linux on IBM Z. This book series assumes that you are generally familiar with IBM Z technology and terminology. It does not assume an in-depth understanding of z/VM or Linux. It is written for individuals who want to start quickly with z/VM and Linux and get virtual servers up and running in a short time, days, not weeks or months. Volume 1 starts with a solution orientation, discusses planning and security, and then describes z/VM installation methods, configuration, hardening, automation, servicing, networking, optional features, and more. It adopts a cookbook style format that provides a concise, repeatable set of procedures for installing, configuring, administering, and maintaining z/VM. This volume also includes a chapter on monitoring z/VM and the Linux virtual servers that are hosted. Volumes 2, 3, and 4 assume that you

completed all of the steps that are described in Volume 1 From that common foundation these volumes describe how to create your own Linux virtual servers on IBM Z hardware under IBM z VM The cookbook format continues with installing and customizing Linux Volume 5 provides an explanation of the kernel based virtual machine KVM on IBM Z and how it can use the z Architecture It focuses on the planning of the environment and provides installation and configuration definitions that are necessary to build manage and monitor a KVM on Z environment This publication applies to the supported Linux on Z distributions Red Hat SUSE and Ubuntu

Semantic View Re-creation for the Secure Monitoring of Virtual Machines

Martim Carbone,2012 The insecurity of modern day software has created the need for security monitoring applications Two serious deficiencies are commonly found in these applications First the absence of isolation from the system being monitored allows malicious software to tamper with them Second the lack of secure and reliable monitoring primitives in the operating system makes them easy to be evaded A technique known as Virtual Machine Introspection attempts to solve these problems by leveraging the isolation and mediation properties of full system virtualization A problem known as semantic gap however occurs as a result of the low level separation enforced by the hypervisor This thesis proposes and investigates novel techniques to overcome the semantic gap advancing the state of the art on the syntactic and semantic view re creation for applications that conduct passive and active monitoring of virtual machines First we propose a new technique for reconstructing a syntactic view of the guest OS kernel s heap state by applying a combination of static code and dynamic memory analysis Our key contribution is the accuracy and completeness of our analysis We also propose a new technique that allows out of VM applications to invoke and securely execute API functions inside the monitored guest s kernel eliminating the need for the application to know details of the guest s internals Our key contribution is the ability to overcome the semantic gap in a robust and secure manner Finally we propose a new virtualization based event monitoring technique based on the interception of kernel data modifications Our key contribution is the ability to monitor operating system events in a general and secure fashion
