input pin INPT is flanked by the VSUM guard pins that track the voltage at the summing node. Connecting the exposed pad of the device to the VSUM pins provides a continuous guard to minimize leakage into the INPT pin.

The **ADL5803** is a monolithic logarithmic detector optimized for the measurement of low frequency signal power in fiber optic systems and offers a large dynamic range in a versatile and easily used form. Wide measurement range and accuracy are achieved using proprietary design and precise laser trimming. The **ADL5803** requires only a single positive supply, V_{DD} , of 5 V. When using low supply voltages, the log slope can be altered to fit the available span. Low quiescent current and chip disable facilitate use in battery-operated applications.

The default value of the logarithmic slope at the VLOG output is set by an internal 5 k Ω resistor. Logarithmic slope can be lowered with an external shunt resistor or increased using the buffer and a pair of external feedback resistors. The addition of a capacitor at the VLOG pin provides a simple low-pass filter. The intermediate voltage, V_{inter} , is buffered in an output stage that can swing to within about 100 mV of ground and the positive supply, V_{cc} , and provides a peak current drive capacity of ± 20 mA. An on-board 2 V reference is provided to facilitate the repositioning of the intercept. The incremental bandwidth of a translinear logarithmic amplifier inherently diminishes for small input currents. At $I_{\text{cc}} = 1$ nA, the bandwidth of the ADL5503 is approximately 2 kHz increasing in proportion to I_{cc} up to a maximum value of 10 MHz.

The input current, I_{in} , flows in the collector of an optimally scaled NPN transistor, connected in a feedback path around a low offset JFET amplifier. The current summing input node operates at a constant voltage, independent of current, with a default value of 0.5 V; this may be adjusted over a wide range. An adaptive biasing scheme is provided for reducing photodiode dark current at very low light input levels. The VPDB pin applies approximately 0.1 V reverse bias across the photodiode for $I_{in} = 100$ pA, rising linearly to 2.0 V of reverse bias at $I_{in} = 10$ nA to improve response time at higher power levels.
