Swanson, 1998-12-01 An experimental investigation was conducted to develop a method of predicting cylinder indicated torques in a reciprocating engine by measurement of crankshaft angular velocity fluctuations Cylinder indicated pressures were measured for all three cylinders of a two stroke Diesel engine with pressure transducers Time resolved angular position was measured at the crankshaft front and at the flywheel A six degree of freedom torsional crankshaft model was developed Two solution methods are described to solve the equations of motion a time marching ODE solver and a Finite Element solution in the time domain Using these methods with the measured cylinder torques the angular positions are predicted and compared to measured angular positions for model calibration An inverse solution method was developed to determine the cylinder indicated torques from the measured angular position at the crankshaft endpoints The method is theoretically demonstrated to be useful for explicit solutions for two stroke engines up to three cylinders and four stroke engines up to four cylinders Experimental results show that the method is useful in predicting cylinder indicated torques from angular velocity measurements *Estimate of Internal Combustion Engine Torque from Measurement of Crankshaft Angular Position* Giorgio Rizzoni, Francis T.
