CHAPTER 11 Properties of Gases

11.1 Gases: Properties and Behaviour

Table 11.1 Properties and Particles of The Three States of Matter

State	Properties	Particles
Solid	• Constant shape • Constant volume • Almost incompressible	• Particles are organized in a regular pattern (this is also known as having “low disorder”) and they vibrate in a fixed position.
Liquid	• Variable shape • Constant volume • Almost incompressible	• Particles are less organized than in a solid and they are able to slide over and past one another.
Gas	• Variable shape • Variable volume • Compressible (can be pushed or squeezed by a force to occupy a smaller volume)	• Particles are much less organized than in other states and they bounce off each other and the walls of their container.

- Each particle of a solid is only able to vibrate around a fixed point, this is called **vibrational motion**.
- Liquid particles move with **rotational motion** as well as **vibrational motion**.
- Gas particles move with all three types of motion: **vibrational, rotational, and translational**.

gas changes to the liquid state. This is known as **condensation**.

Forces Between Particles

Attractions Between Charged Particles

electrostatic attraction

Ionic bonds, strong, solids

Attractions Between Polar Molecules

Intermolecular forces are forces that exist between neutral molecules, or between molecules and ions.

dipole–dipole

Attractions Between Non-Polar Molecules

dispersion forces

The Relationship Between Size and State

molecules size ↑, melting and boiling points ↑.

Methane (CH_4) small non-polar molecule, very low boiling point, gas at room temperature.

Pentane (C_5H_{12}) is a larger non-polar molecule, higher boiling point, liquid at room temperature.

The Effect of Kinetic Energy on the State of a Substance

temperature ↑, kinetic energy ↑, substance changes in state

Kinetic Molecular Theory of Gases

The kinetic molecular theory of gases makes the following assumptions:

- The volume of an individual gas molecule.
