Bit-string Physics H. Pierre Noyes, J. C. van den Berg, 2001 We could be on the threshold of a scientific revolution. Quantum mechanics is based on unique finite and discrete events. General relativity assumes a continuous curved space-time. Reconciling the two remains the most fundamental unsolved scientific problem left over from the last century. The papers of H. Pierre Noyes collected in this volume reflect one attempt to achieve that unification by replacing the continuum with the bit-string events of computer science. Three principles are used: physics can determine whether two quantities are the same or different; measurement can tell something from nothing; this structure modeled by binary addition and multiplication can leave a historical record consisting of a growing universe of bit strings. This book is specifically addressed to those interested in the foundations of particle physics, relativity, quantum mechanics, physical cosmology and the philosophy of science.

package MATLAB as well as to serve as a quick reference to some of the most used instructions in the package A unique
feature of this handbook is that it can be used by the novice and by experienced users alike For experienced users it has four
chapters with examples and applications in engineering finance physics and optimization Exercises are included along with

Provides an introduction to object oriented programming using MATLAB Includes applications from many areas Includes the
realization of executable files for MATLAB programs and Simulink models **Theory of Gyroscopic Effects for Rotating
Objects** Ryspek Usubamatov, 2022-06-30 This book highlights an analytical solution for the dynamics of axially rotating
objects It also presents the theory of gyroscopic effects explaining their physics and using mathematical models of Euler s
form for the motion of movable spinning objects to demonstrate these effects The major themes and approaches are
represented by the spinning disc and the action of the system of interrelated inertial torques generated by the centrifugal
and Coriolis forces as well as the change in the angular momentum The interrelation of inertial torques is based on the
dependency of the angular velocities of the motions of the spinning objects around axes by the principle of mechanical
energy conservation These kinetically interrelated torques constitute the fundamental principles of the mechanical gyroscope
theory that can be used for any rotating objects of different designs like rings cones spheres paraboloids propellers etc Lastly
the mathematical models for the gyroscopic effects are validated by practical tests The 2nd edition became necessary due to
new development and corrections of mathematical expressions It contains new chapters about the Tippe top inversion and
inversion of the spinning object in an orbital flight and the boomerang aerodynamics **Constructing Scientific
Understanding Through Contextual Teaching** Peter Heering, Daniel Osewold, 2007-01-01 Learning by Doing is about the

history of experimentation in science education The teaching of science through experiments and observation is essential to the natural sciences and its pedagogy These have been conducted as both demonstration or as student exercises The experimental method is seen as giving the student vital competence skills and experiences both at the school and at the university level This volume addresses the historical development of experiments in science education which has been largely neglected so far The contributors of Learning by Doing pay attention to various aspects ranging from economic aspects of instrument making for science teaching to the political meanings of experimental science education from the 17th to the 20th century This collected volume opens the field for further debate by emphasizing the importance of experiments for both historians of science and science educators Presentation de l'éditeur **Scientific and Technical Aerospace Reports**, 1970

Innovative Computational Intelligence: A Rough Guide to 134 Clever Algorithms Bo Xing, Wen-Jing Gao, 2013-12-13 The first notable feature of this book is its innovation Computational intelligence CI a fast evolving area is currently attracting lots of researchers attention in dealing with many complex problems At present there are quite a lot competing books existing in the market Nevertheless the present book is markedly different from the existing books in that it presents new paradigms of CI that have rarely mentioned before as opposed to the traditional CI techniques or methodologies employed in other books During the past decade a number of new CI algorithms are proposed Unfortunately they spread in a number of unrelated publishing directions which may hamper the use of such published resources These provide us with motivation to analyze the existing research for categorizing and synthesizing it in a meaningful manner The mission of this book is really important since those algorithms are going to be a new revolution in computer science We hope it will stimulate the readers to make novel contributions or even start a new paradigm based on nature phenomena Although structured as a textbook the book's straightforward self contained style will also appeal to a wide audience of professionals researchers and independent learners We believe that the book will be instrumental in initiating an integrated approach to complex problems by allowing cross fertilization of design principles from different design philosophies The second feature of this book is its comprehensiveness Through an extensive literature research there are 134 innovative CI algorithms covered in this book **Physics for Scientists and Engineers** Raymond A. Serway, John W. Jewett, 2008 Dynamical Systems and Applications Ravi P. Agarwal, 1995 World Scientific series in Applicable Analysis WSSIAA aims at reporting new developments of high mathematical standard and current interest Each volume in the series shall be devoted to the mathematical analysis that has been applied or potentially applicable to the solutions of scientific engineering and social problems For the past twenty five years there has been an explosion of interest in the study of nonlinear dynamical systems Mathematical techniques developed during this period have been applied to important nonlinear problems ranging from physics and chemistry to ecology and economics All these developments have made dynamical systems theory an important and attractive branch of mathematics to scientists in many disciplines This rich mathematical subject has been partially
