Performance Analysis of Cognitive Radio Networks for Resource Sharing Kamal Chapagain, Nanda Bikram Adhikari, 2014-10-07 In cognitive radio system secondary users are queued when primary users are utilizing its own channel In that case secondary transmitters are idle and waiting for that channel to be freed If so why not use that idle secondary transmitter for primary users as helping hands by transmitting primary s data This book explore the

scarcity and management of current spectrum issue and proper management in three distinct methodologies Firstly Field surveying of spectrum within the range of 0.1 GHz to 3 GHz is done for finding white space Secondly white space is managed using user friendly graphical environment programmed in Matlab Finally performance is increased by reducing waiting delay in queue for secondary users Sharing 50% of primary users data by secondary transmitter performance is increased up to 41% based on traffic load of incoming data on server and better on high traffic Wireless Regional Area Network IEEE 802.22 parameters with data rate 24 Mbps is used for simulation in Matlab

Spectrum Usage Models for the Analysis, Design and Simulation of Cognitive Radio Networks Miquel López Benítez, Fernando José Casadevall Palacio, Universitat Politècnica de Catalunya. Departament de Teoria del Senyal i Comunicacions, 2011

Adaptive Weighting of Multi-taper Spectrum Sensing in Cognitive Radio Networks, 2020-03-18 Master's Thesis from the year 2019 in the subject Mathematics Applied Mathematics grade Master Degree language English abstract This thesis discusses the performance enhancement of multi taper spectrum sensing as a powerful technique for cognitive radio networks In multi taper spectrum sensing regular detection of unused spectrum holes is performed to make cognitive radio networks aware of users activities As a result more effective spectrum management is expected and unlicensed users could use unused spectrum holes In this thesis an analytical study was proposed in which reliable simple and computationally efficient mathematical expressions for the mean and variance of the probability density function PDF of the multitaper spectrum sensing techniques were derived The proposed analytical study was evaluated by intensive simulations using MATLAB The presence of Additive White Gaussian Noise is assumed Many important aspects of spectrum sensing in cognitive radio networks are included such as receiver operating characteristics detection rate versus signal to noise ratio SNR and the minimum required sample points for a specific performance All simulations were performed

to include most factors affecting the efficiency of the proposed sensing methodology such as number of tapers K number of sample points N and the probability of false alarm P_f A comparison with energy detection method was done All simulation results and comparisons confirm that the proposed model is reliable and robust under all factors considered in the simulation

Dissertation Abstracts International, 2008 Quantitative Analysis of Cognitive Radio and Network Performance

Preston Marshall, 2010 Cognitive radio a paradigm for wireless communication in which either a network or a wireless node changes its transmission or reception parameters to communicate more efficiently and avoid interference is one of the most exciting emerging fields in communications technology Taking an integrated development approach this cutting edge book provides you with clear methods for performing quantitative analysis of cognitive radio techniques in a variety of environments This detailed reference presents a quantitative structure that helps you determine the capability of cognitive radio to address a number of constraints of current radio design Critical to understanding the operation of cognitive radio the book develops an analytic model for a range of spectrum environments Moreover this unique resource offers you unique insight into the application of dynamic spectrum access DSA to improve the performance of all classes of wireless devices DVD Included Contains sample cognitive radio environments and closed form approximations of these environments in MATLAB file format This data enables you to reproduce the analysis provided in the book perform the exercises in each chapter and extend the work through independent investigation and research **Cognitive Radio** Omar Hamad

Altrad, 2013 Efficient utilization of the spectrum has become a fundamental requirement in modern wireless networks due mainly to spectrum scarcity and the ever increasing demand for higher data rate applications and internet services A particularly interesting proposal to meet this requirement is the cognitive radio CR system which can adapt its transmission parameters according to the environment CRs as will be shown in later chapters are very efficient in maximizing spectrum utilization due to their inherent spectrum sensing capability The purpose of this dissertation is to investigate and analyze two main components of CR First is the sensing or exploring component which is the core of a CR device as it is the first stage to discover spectrum holes SHs in a spectrum band For this component a new algorithm to compute the detection probability in the case of odd degrees of freedom and a closed form expression for the detection probability in Nakagami m fading channels are presented both for a local spectrum sensing scenario For a cooperative scenario the errors of CRs decisions which are caused by erroneous feedback channels are analyzed In addition the optimal number of CRs that are required to mitigate against such errors is derived The second component is the access or exploiting component i.e. how a CR device can exploit SHs efficiently To study the second component the interactions between the primary users PUs and secondary users SUs are modeled as a continuous time Markov chain CTMC Based on the CTMC model the effect of two inevitable sensing errors misdetection and false alarm on the blocked call probability the dropped call probability and system utilization is investigated for two access schemes In the first scheme the PUs are considered to access the system using a standard access policy In the

second scheme the PUs use non standard access policies In both schemes the overall primary and secondary system utilization is analyzed and compared under both perfect and imperfect sensing The simulation results obtained concur with the analytical ones and it is determined that spectrum utilization can be improved by choosing a suitable non standard access policy
