Urban Traffic System Abdul Azeez Kadar Hamsa, 2020 The urban traffic system constitutes a group of interdependent and interrelated traffic and related components which are intended to form a unified entity to accomplish smooth orderly and safe movement of vehicles in an urban area. Trip attractions at urban areas are normally very high due to high density commercial and business land uses. As a result, the increasing number of vehicles, especially private cars travelling towards city areas, has caused tremendous pressure on the limited road and related infrastructure, especially in urban areas. Increase in traffic congestion environmental pollution travel time discomfort and inconveniences and decrease in speed are the common and regular effects resulting from increased traffic volume and limited road infrastructure. Understanding the effects of increase in traffic trends on road and related infrastructure is thus important. This book emphasizes on the characteristics of traffic components which include road network and road geometrics traffic volume speed road intersection road capacity level of service parking traffic control devices road safety traffic management measures and traffic calming. This book is expected to further strengthen the literature on each of the selected traffic components especially in the local context. It is also expected to benefit students especially in higher learning.
