Trees Jean-Pierre Serre, 2002-11-25 The seminal ideas of this book played a key role in the development of group theory since the 70s Several generations of mathematicians learned geometric ideas in group theory from this book In it the author proves the fundamental theorem for the special cases of free groups and tree products before dealing with the proof of the general case This new edition is ideal for graduate students and researchers in algebra geometry and topology **Local**

Fields Jean-Pierre Serre, 2013-06-29 The goal of this book is to present local class field theory from the cohomological point of view following the method inaugurated by Hochschild and developed by Artin Tate This theory is about extensions primarily abelian of local i.e. complete for a discrete valuation fields with finite residue field For example such fields are obtained by completing an algebraic number field that is one of the aspects of localisation The chapters are grouped in parts There are three preliminary parts the first two on the general theory of local fields the third on group cohomology Local class field theory strictly speaking does not appear until the fourth part Here is a more precise outline of the contents of these four parts The first contains basic definitions and results on discrete valuation rings Dedekind domains which are their globalisation and the completion process The prerequisite for this part is a knowledge of elementary notions of algebra and topology which may be found for instance in Bourbaki The second part is concerned with ramification phenomena different discriminant ramification groups Artin representation Just as in the first part no assumptions are made here about the residue fields It is in this setting that the norm map is studied I have expressed the results in terms of additive polynomials and of multiplicative polynomials since using the language of algebraic geometry would have led me too far astray **A**

Fields Jean-Pierre Serre, 2012-12-06 Translation of the French Edition *Basic Modern Theory of Linear Complex Analytic q -Difference Equations* Jacques Sauloy, 2024-11-06 The roots of the modern theories of differential and q difference equations go back in part to an article by George D Birkhoff published in 1913 dealing with the three sister theories of differential difference and q difference equations This book is about q difference equations and focuses on techniques inspired by differential equations in line with Birkhoff's work as revived over the last three decades It follows the approach of the Ramis school mixing algebraic and analytic methods While it uses some q calculus and is illustrated by q special functions these are not its main subjects After a gentle historical introduction with emphasis on mathematics and a thorough study of basic problems such as elementary q functions elementary q calculus and low order equations a detailed algebraic and analytic study of scalar equations is followed by the usual process of transforming them into systems and back again The structural algebraic and analytic properties of systems are then described using q difference modules Newton polygon filtration by the slopes The final chapters deal with Fuchsian and irregular equations and systems including their resolution classification Riemann Hilbert correspondence and Galois theory Nine appendices complete the book and aim to help the reader by providing some fundamental yet not universally taught facts There are 535 exercises of various styles and levels of difficulty The main prerequisites are general algebra and analysis as taught in the first three years of university The book will be of interest to expert and non expert researchers as well as graduate students in mathematics and physics

Forms of Fermat Equations and Their Zeta Functions Lars Brønjes, 2004 In this volume an abstract theory of forms of Fermat equations is developed thus providing a conceptually satisfying framework for the classification of forms of Fermat equations The classical results on diagonal forms are extended to the broader class of all forms of Fermat varieties

Maximal Cohen-Macaulay Modules and Tate Cohomology Ragnar-Olaf Buchweitz, 2021-12-16 This book is a lightly edited version of the unpublished manuscript *Maximal Cohen Macaulay modules and Tate cohomology over Gorenstein rings* by Ragnar Olaf Buchweitz The central objects of study are maximal Cohen Macaulay modules over not necessarily commutative Gorenstein rings The main result is that the stable category of maximal Cohen Macaulay modules over a Gorenstein ring is equivalent to the stable derived category and also to the homotopy category of acyclic complexes of projective modules This assimilates and significantly extends earlier work of Eisenbud on hypersurface singularities There is also an extensive discussion of duality phenomena in stable derived categories extending Tate duality on cohomology of finite groups Another noteworthy aspect is an extension of the classical BGG correspondence to super algebras There are numerous examples that illustrate these ideas The text includes a survey of developments subsequent to and connected with Buchweitz's manuscript

Rational Points on Varieties Bjorn Poonen, 2023-08-10 This book is motivated by the problem of determining the set of rational points on a variety but its true goal is to equip readers with a broad range of tools essential for current research in algebraic geometry and number theory The book is unconventional in that it provides concise accounts of many topics

instead of a comprehensive account of just one this is intentionally designed to bring readers up to speed rapidly Among the topics included are Brauer groups faithfully flat descent algebraic groups torsors tale and fppf cohomology the Weil conjectures and the Brauer Manin and descent obstructions A final chapter applies all these to study the arithmetic of surfaces The down to earth explanations and the over 100 exercises make the book suitable for use as a graduate level textbook but even experts will appreciate having a single source covering many aspects of geometry over an unrestricted ground field and containing some material that cannot be found elsewhere The origins of arithmetic or Diophantine geometry can be traced back to antiquity and it remains a lively and wide research domain up to our days The book by Bjorn Poonen a leading expert in the field opens doors to this vast field for many readers with different experiences and backgrounds It leads through various algebraic geometric constructions towards its central subject obstructions to existence of rational points Yuri Manin Max Planck Institute Bonn It is clear that my mathematical life would have been very different if a book like this had been around at the time I was a student Hendrik Lenstra University Leiden Understanding rational points on arbitrary algebraic varieties is the ultimate challenge We have conjectures but few results Poonen's book with its mixture of basic constructions and openings into current research will attract new generations to the Queen of Mathematics Jean Louis Colliot Thélène Université Paris Sud A beautiful subject handled by a master Joseph Silverman Brown University

Local Algebra
 Jean-Pierre Serre, 2012-12-06 The present book is an English translation of *Algebre Locale Multiplicités* published by Springer Verlag as no 11 of the Lecture Notes series The original text was based on a set of lectures given at the Collège de France in 1957-1958 and written up by Pierre Gabriel Its aim was to give a short account of Commutative Algebra with emphasis on the following topics a Modules as opposed to Rings which were thought to be the only subject of Commutative Algebra before the emergence of sheaf theory in the 1950s b Homological methods a la Cartan Eilenberg c Intersection multiplicities viewed as Euler Poincaré characteristics The English translation done with great care by Chee Whye Chin differs from the original in the following aspects The terminology has been brought up to date e.g. cohomological dimension has been replaced by the now customary depth I have rewritten a few proofs and clarified or so I hope a few more A section on graded algebras has been added App III to Chap IV New references have been given especially to other books on Commutative Algebra Bourbaki whose Chap X has now appeared after a 40 year wait Eisenbud Matsumura Roberts I hope that these changes will make the text easier to read without changing its informal Lecture Notes character
