Handbook of Combinatorial Optimization Ding-Zhu Du, Panos M. Pardalos, 2013-03-14 Combinatorial or discrete optimization is one of the most active fields in the interface of operations research computer science and applied mathematics Combinatorial optimization problems arise in various applications including communications network design VLSI design machine vision air line crew scheduling corporate planning computer aided design and manufacturing database query design cellular telephone frequency assignment constraint directed reasoning and computational biology Furthermore combinatorial optimization problems occur in many diverse areas such as linear and integer programming graph theory artificial intelligence and number theory All these problems when formulated mathematically as the minimization or maximization of a certain function defined on some domain have a commonality of discreteness Historically combinatorial optimization starts with linear programming Linear programming has an entire range of important applications including production planning and distribution personnel assignment finance allocation of economic resources circuit simulation and control systems Leonid Kantorovich and Tjalling Koopmans received the Nobel Prize 1975 for their work on the optimal allocation of resources Two important discoveries the ellipsoid method 1979 and interior point approaches 1984 both provide polynomial time algorithms for linear programming These algorithms have had a profound effect in combinatorial optimization Many polynomial time solvable combinatorial optimization problems are special cases of linear programming e.g. matching and maximum flow In addition linear programming relaxations are often the basis for many approximation algorithms for solving NP hard problems e.g. dual heuristics

Combinatorial Optimization and Applications Guohui Lin, 2012-07-26 This book constitutes the refereed proceedings of the 6th International Conference COCOA 2012 held in Banff Alberta Canada in August 2012 The 33 revised papers including one invited talk and one keynote talk were carefully reviewed and selected from 57 submissions The papers are focused to theoretical results and also on recent works on experimental and applied research of general algorithmic interest

Exponential Time Algorithms Serge Gaspers, 2010-02 This book studies exponential time algorithms for NP hard problems In this modern area the aim is to design algorithms for combinatorially hard problems that execute provably faster than a brute force enumeration of all candidate solutions After an introduction and survey of the field the text focuses first on the design and especially the analysis of branching algorithms The analysis of these algorithms heavily relies on measures of the instances which aim at capturing the structure of the instances not merely their size This makes them more appropriate to quantify the progress an algorithm makes in the process of solving a problem Expanding the methodology to design exponential time algorithms new techniques are then presented Two of them combine treewidth based algorithms with branching or enumeration algorithms Another one is the iterative compression technique prominent in the design of parameterized algorithms and adapted here to the design of exponential time algorithms This book assumes basic knowledge of algorithms and should serve anyone interested in exactly solving hard
