Abstract: Hepatitis E virus (HEV) is responsible for epidemics and endemics of acute hepatitis in humans, mainly through waterborne, foodborne, and zoonotic transmission routes. HEV is a single-stranded, positive-sense RNA virus classified in the family *Hepeviridae* and encompasses four known Genotypes (1–4), at least two new putative genotypes of mammalian HEV, and one floating genus of avian HEV. Genotypes 1 and 2 HEVs only affect humans, while Genotypes 3 and 4 are zoonotic and responsible for sporadic and autochthonous infections in both humans and several other animal species worldwide. HEV has an ever-expanding host range and has been identified in numerous animal species. Swine serve as a reservoir species for HEV transmission to humans; however, it is likely that other animal species may also act as reservoirs. HEV poses an important public health concern with cases of the disease definitively linked to handling of infected pigs, consumption of raw and undercooked animal meats, and animal manure contamination of drinking or irrigation water. Infectious HEV has been identified in numerous sources of concern including animal feces, sewage water, inadequately-treated water, contaminated shellfish and produce, as well as animal meats. Many aspects of HEV pathogenesis, replication, and immunological responses remain unknown, as HEV is an extremely understudied but important human pathogen. This article reviews the current understanding of HEV transmission routes with emphasis on food and environmental sources and the prevalence of HEV in animal species with zoonotic potential in humans.

Hepatitis E Virus Foodborne Waterborne And Zoonotic:

Hepatitis E Virus Franco Maria Ruggeri, Ilaria Di Bartolo, Fabio Ostanello, Marcello Trevisani, 2013-06-06 Hepatitis E HEV is a viral infectious disease that infects humans and domestic wild and synanthropic animals alike In developing countries the disease often presents as an epidemic transmitted primarily through the fecal oral route In recent years sporadic cases have also been documented in industrial countries including Europe The identification and characterization of animal strains of HEV from pigs wild boar and deer and the demonstrated ability of cross species infection by these animal strains raise potential public health concerns for foodborne and zoonotic transmission of the virus This Brief will provide a thorough overview of HEV It will discuss the epidemiology and pathogenesis of the virus in both humans and animals review detection methods and provide methods for its control and prevention

Hepatitis E Virus Youchun Wang, 2023-05-24 This book systematically and comprehensively discusses the biological epidemiological and clinical characteristics of the hepatitis E virus HEV It presents current knowledge of HEV and explores experimental methods treatment and prevention of HEV First identified in the 1980s and cloned in 1990 HEV is the causative agent of hepatitis E which mainly occurs in developing regions such as Southeast Asia the Middle East and Africa and significantly affects the health of the people in these areas It is estimated that a third of the world's population has been infected with HEV which is transmitted via the fecal oral route and can infect both humans and animals In the second edition new chapters are added to demonstrate the lifecycle morphogenesis and stem cell culture of hepatitis E virus Although research on hepatitis E virus has made progress recently there are still some problems that have not been solved Those problems are discussed in this edition which would be helpful for researchers to understand the problems on hepatitis E virus that they have faced Meanwhile the epidemiology transmission genetic evolution animal models treatment and others in the related chapters of the first version were also updated according to the most recent research progress The book provides an overview of HEV from benchside to bedside It is a valuable resource for researchers in the field and those in the pharmaceutical industry developing HEV vaccines as well as physicians involved in identifying and treating those infected with the virus

Handbook of Foodborne Diseases Dongyou Liu, 2018-10-29 Clearly linked to consumption of foods beverages and drinking water that contain pathogenic microbes toxins or other toxic agents foodborne diseases have undergone a remarkable change of fortune in recent decades from once rare and insignificant malaises to headline grabbing and deadly outbreaks Unquestionably several factors have combined to make this happen These include a prevailing demand for the convenience of ready to eat or heat and eat manufactured food products that allow ready entry and survival of some robust temperature insensitive microorganisms a drastic reduction in the costs of air sea and road transportation that has taken some pathogenic microorganisms to where they were absent previously an expanding world population that has stretched the boundary of human activity and an ageing population whose weakened immune functions provide a fertile ground for opportunistic pathogens to invade and thrive

Given the diversity of causative agents ranging from viruses bacteria yeasts filamentous fungi protozoa helminthes toxins to toxic agents and the ingenuity of pathogenic microbes to evolve through genetic reassortment horizontal gene transfer and or random genetic mutation it has become an enormous challenge to understand how foodborne agents are able to evade host immune defenses and induce diseases and also to develop and apply innovative approaches for improved diagnosis treatment and prevention of foodborne diseases Handbook of Foodborne Diseases summarizes the latest findings on more than 100 foodborne diseases and their causative agents With contributions from international experts on foodborne pathogens toxins and toxic agents research this volume provides state of the art overviews on foodborne diseases in relation to their etiology biology epidemiology clinical presentation pathogenesis diagnosis treatment and prevention Apart from offering a comprehensive textbook for undergraduate and postgraduate students in food medical and veterinary microbiology this volume constitutes a valuable reference on foodborne diseases for medical professionals and health authorities and forms an informative educational resource for the general public

Laboratory Models for Foodborne Infections

Dongyou Liu,2017-03-16 Resulting from ingestion of inappropriately prepared or stored foods containing pathogenic viruses bacteria fungi and parasites foodborne infections have become a significant source of human morbidity and mortality worldwide in recent decades This may be largely attributable to the remarkable popularity of convenient ready to eat food products the dramatic expansion of international food trades and the continuing growth of immuno suppressed population groups Although anti microbial treatments have played a crucial part in the control of foodborne infections in the past the emergence and spread of anti microbial resistance render the existing treatments ineffective Additionally our limited understanding of the molecular mechanisms of foodborne infections has thwarted our efforts in the development of efficacious vaccines for foodborne pathogens Given the obvious benefits of laboratory models in foodborne disease research a great number of experiments have been conducted toward the elucidation of host pathogen interactions in and pathogenic mechanisms of foodborne infections Forming part of the Food Microbiology series Laboratory Models for Foodborne Infections presents a state of the art review of laboratory models that have proven valuable in deciphering the life cycle epidemiology immunobiology and other key aspects of foodborne pathogens Written by scientists with respective expertise in foodborne pathogen research each chapter includes a contemporary summary of a particular foodborne viral bacterial fungal or parasitic infection in relation to its life cycle epidemiology clinical features pathogenesis host pathogen interactions and other related aspects Besides providing a trustworthy source of information for undergraduates and postgraduates in food microbiology Laboratory Models for Foodborne Infections offers an invaluable guide for scientists and food microbiologists with interest in exploiting laboratory models for detailed study of foodborne infections

and the management of co infections The book opens by examining the local and global epidemiology of acute hepatitis Detailed attention is then paid to each of acute hepatitis A acute hepatitis B acute hepatitis C hepatitis D co infection and hepatitis E Acute Hepatitis will be of high value for general practitioners and specialists in gastroenterology infectious diseases and internal medicine It will be international in scope in terms of both authorship and appeal

Emerging and Transboundary Animal Viruses Yashpal Singh Malik,Raj Kumar Singh,Mahendra Pal Yadav,2020-02-22 This book which is the first volume of the book series Livestock Diseases and Management summarizes the prominence and implications of the emerging and transboundary animal viruses Although the livestock plays an important role in the economy of many countries the emerging and transboundary animal viral diseases possess a serious risk to the animal agriculture sector and food security globally The book describes the precise and up to date information on animal viral diseases which have emerged in the recent past or are re emerging due to various environmental factors and those which are not bounded in restricted national boundaries and attained the transboundary status The chapters summarize the recent advancements in the molecular state of art tools towards the development of diagnostics prophylactics and therapeutics of these viruses It also explicitly describes the challenges imposed by the emerging and transboundary viral infections and our preparedness to counter them

Clinical Epidemiology of Chronic Liver Diseases Robert J. Wong,Robert G. Gish,2018-10-24 This book emphasizes the clinical epidemiology of chronic liver diseases with a specific focus on the methodology of the discussed studies The whole spectrum of liver diseases is covered from chronic hepatitis B and C to hepatocellular carcinoma alcoholic and non alcoholic fatty liver diseases and autoimmune and cholestatic liver diseases Readers will find the most up to date information on clinical epidemiology of hepatology and will also be able to learn about important methodology and biostatistics information Each chapter contains a summary table at the end of each chapter that highlights the most relevant landmark studies their main outcomes and the unique features of the methodology The book will appeal to both practicing clinicians as well as clinical research investigators In addition this would likely be of interest to medical school or public health school students to learn about hepatology epidemiology but also some specific fundamentals of clinical research and clinical epidemiology

Food Preservation and Safety of Natural Products Helen N. Onyeaka,Ozioma F. Nwabor,2022-06-15 Food Preservation and Safety of Natural Products addresses the most common causes of food spoilage that create significant loss to global food production while also discussing how food serves as a vehicle for the transmission of pathogenic microorganisms responsible for mild to debilitating health conditions in humans The book provides essential information for food safety professionals on issues relating to foodborne diseases and offers potential solutions by presenting various methods of incorporating natural products in food production to prevent the spread of foodborne pathogenic organisms The demand for green consumerism and consumers general distaste for synthetic food additives poses a serious challenge to food safety and preservation Natural products are used as green and sustainable source of bioactive compounds

that can be applied in various fields including food The use of plant and other natural products in food preservation is on the rise hence this book reviews microbial mediated food spoilage foodborne pathogens and food contamination and offers applications of natural products in food preservation Provides important information on microbial metabolic by products natural enzymatic processes to prevent food spoilage or deterioration Includes molecular techniques for antimicrobial and antioxidant applications in food food packaging and edible films Presents the latest evidence based science on the natural products used as additives in food

Natural Food Preservation: Controlling Loss, Advancing Safety Slavica Veskovc, 2025-03-26 Controlling food spoilage is critical not only to maintaining public health but also to minimizing food loss which in turn has broad impacts on the economy and the environment Consumers today concerned with both human and ecological health are adamant that the elimination of risk for foodborne disease need not come at the cost of nutritional quality or ecological considerations Moreover a large factor towards the continued threat of foodborne illness is the fact that the responsible bacteria are increasingly resistant to conventional antibiotics Considering that nature provides abundant antimicrobial compounds it is salutary to assess the role that these compounds can play in fighting foodborne pathogens As a result of these demands and considerations natural antimicrobials are beginning to gain ground over their synthetic counterparts in industrial food safety processes The success of these antimicrobial agents in individual settings has demonstrated that safe food does not have to mean highly processed or less sensorially satisfying food Natural Preservation Safety Losses and Protection will discuss the economic and ecological benefits of a food industry moving away from dependence on synthetic chemicals and preservatives and illustrate the impact that the extension of shelf life for the minimization of food waste can have on food insecurity across the globe Readers can expect an overview of safety that considers economic as well as ecological interests and assesses each stage of the food processing chain for its role in improving the nutritional physicochemical and sensory values of the product This includes a discussion of lactic acid bacteria LAB and their secondary metabolic products bacteriocins and how their application to fermentation processes can expand the possibilities for natural approaches to food safety with major implications for global health and ecology This volume demonstrates the integral role bio protectors can play in production processes promoting their potential while also outlining the necessity for appropriate laboratory industrial and medical evaluations to ensure their efficacy and win their approval by regulatory bodies The perspectives offered will be valuable to researchers policymakers and industry professionals with investments in building a more sustainable and more equitable food system
