

Chapter 23

Multilane Highways

23.1 Introduction

Increasing traffic flow has made necessary the provision of facilities for several types of highways as needed to provide direct communication facilities to the users. The basic requirements of these facilities in the present day include (a) sufficient capacity, (b) operational characteristics, (c) safety and level of service. Light weight, low operational resistance to the vehicles and low resistance to wear and tear provide the key to the success of the facility.

23.2 Multilane Highways

A highway is a public road especially a major road connecting two or more communities. It represents either a main road having the characteristics of a traffic artery function, with no access for all traffic except at points, and that such main arterial highways are the best or designated route between two cities, towns, etc. It is called an **arterial highway**. **Multilane highways** refer to a category of highways that include both multilane arterials and multilane freeways. Such highways are designed to provide the maximum flow of traffic and to provide a high level of service to the users. They are designed to provide a high level of service to the users. They are designed to provide a high level of service to the users.

23.2.1 Highway Classification

Although there are various methods of classification of highways, the most common one is based on the number of lanes. The Highway can be classified as:

- Two-lane highways
- Four-lane highways
- Six-lane highways
