underlying fields of optics photonics and vision science it comprises four parts PART I is devoted to fundamentals The behavior of light is described in terms of rays waves and photons Each of these approaches is best suited to a particular set of applications The properties of blackbody radiation thermal light and incandescent light are derived and explained The essentials of semiconductor physics are set forth including the operation of junctions and heterojunctions quantum wells and quantum dots and organic and perovskite semiconductors PART II deals with the generation of light in semiconductors and details the operation and properties of III V semiconductor devices MQWLEDs microLEDs quantum dot devices QLEDs WQLEDs organic semiconductor devices OLEDs SMOLEDs PLEDs WOLEDs and perovskite devices PeLEDs PPeLEDs QPeLEDs PeWLEDs PART III focuses on vision and the perception of color as well as on colorimetry It delineates radiometric and photometric quantities as well as various measures of luminous efficacy and efficiency It also elucidates the significance of commonly used LED lighting metrics such as the color rendering index CRI color temperature CT correlated color temperature CCT and chromaticity diagram PART IV is devoted to LED lighting focusing on its history and salutary features and on how this modern form of illumination is deployed It describes the principal components used in LED lighting including phosphor conversion LEDs PCLEDs for generating cool and warm white light chip on board COB devices color mixing LEDs LED filaments retrofit LED lamps hybrid devices LED luminaires and OLED light panels It concludes with a discussion of smart and connected lighting that reviews plant centric lighting and highlights the roles of gamma and circadian brain rhythms in human centric lighting Finally the performance metrics for traditional and LED light sources are summarized Each chapter contains practical examples highlighted equations color coded figures and an extensive bibliography

**Nanostructured Solar Cells** Narottam Das, 2017-02-22 Nanostructured solar cells are very important in renewable energy sector as well as in environmental aspects because it is environment friendly The nano grating structures such as triangular or conical shaped have a gradual change in refractive index which acts as a multilayer antireflective coating that is leading to reduced light reflection losses over broadband ranges of wavelength and angle of incidence There are different types of losses in solar cells that always reduce the conversion efficiency but the light reflection loss is the most important factor that decreases the conversion efficiency of solar cells significantly The antireflective coating is an optical coating which is applied to the surface of lenses or any optical devices to reduce the light reflection losses This coating assists for the light trapping capturing capacity or improves the efficiency of optical devices such as lenses or solar cells Hence the multilayer antireflective coatings can reduce the light reflection losses and increases the conversion efficiency of nanostructured solar cells

**Millimeter-Wave Power Amplifiers** Jaco du Preez, Saurabh Sinha, 2017-10-05 This book provides a detailed review of millimeter wave power amplifiers discussing design issues and performance limitations commonly encountered in light of the latest research Power amplifiers which are able to provide high levels of output power and linearity while being easily integrated with surrounding circuitry are a crucial component in wireless microwave systems

The book is divided into three parts the first of which introduces readers to mm wave wireless systems and power amplifiers In turn the second focuses on design principles and EDA concepts while the third discusses future trends in power amplifier research The book provides essential information on mm wave power amplifier theory as well as the implementation options and technologies involved in their effective design equipping researchers circuit designers and practicing engineers to design model analyze test and implement high performance spectrally clean and energy efficient mm wave systems

**Near Infrared Detectors Based on Silicon Supersaturated with Transition Metals** Daniel Montero Álvarez,2021-01-08 This thesis makes a significant contribution to the development of cheaper Si based Infrared detectors operating at room temperature In particular the work is focused in the integration of the Ti supersaturated Si material into a CMOS Image Sensor route the technology of choice for imaging nowadays due to its low cost and high resolution First the material is fabricated using ion implantation of Ti atoms at high concentrations Afterwards the crystallinity is recovered by means of a pulsed laser process The material is used to fabricate planar photodiodes which are later characterized using current voltage and quantum efficiency measurements The prototypes showed improved sub bandgap responsivity up to 0.45 eV at room temperature The work is further supported by a collaboration with STMicroelectronics where the supersaturated material was integrated into CMOS based sensors at industry level The results show that Ti supersaturated Si is compatible in terms of contamination process integration and uniformity The devices showed similar performance to non implanted devices in the visible region This fact leaves the door open for further integration of supersaturated materials into CMOS Image Sensors
