Referent control of action and perception Anatol G. Feldman, 2015-06-18 Empirical data on neural control of motor action and perception have not yet been put into the context of a coherent theory Dr Feldman s goal for the proposed book is to illustrate that the field is now at a stage where the data can be used to formulate some core principles that underlie action and perception and to present the foundation of a scientific theory of motor control Dr Feldman is a well known expert and has been active in the field for a long time In the proposed book he will outline an approach to the analysis of action and perception that he and his colleagues have been using for the past 50 years or so His theoretical approach will not only help to explain past empirical research but should also help to inform and provide a structure for future empirical studies

Principles of Behavioral Neuroscience Beatty, 1995-02

Motor Control and Learning, 6E Schmidt, Richard A., Lee, Tim, Winstein, Carolee, Wulf, Gabriele, Zelaznik, Howard, 2019 *Motor Control and Learning* Sixth Edition focuses on observable movement behavior the many factors that influence quality of movement and how movement skills are acquired

Sensorimotor Control of Movement and Posture Simon C. Gandevia, Uwe Proske, Douglas G. Stuart, 2012-11-05 This collection of contributions on the subject of the neural mechanisms of sensorimotor control resulted from a conference held in Cairns Australia September 3 6 2001 While the three of us were attending the International Union of Physiological Sciences IUPS Congress in St Petersburg

Russia in 1997 we discussed the implications of the next Congress being awarded to New Zealand We agreed to organise a satellite to this congress in an area of mutual interest the neuroscience of movement and sensation Australia has a long standing and enviable reputation in the field of neural mechanisms of sensorimotor control Arguably this reached its peak with the award of a Nobel Prize to Sir John Eccles in 1963 for his work on synaptic transmission in the central nervous system Since that time the subject of neuroscience has progressed considerably One advance is the exploitation of knowledge acquired from animal experiments to studies on conscious human subjects In this development Australians have achieved international prominence particularly in the areas of kinaesthesia and movement control This bias is evident in the choice of subject matter for the conference and subsequently this book It was also decided to assign a whole section to muscle mechanics a subject that is often left out altogether from conferences on motor control Cairns is a lovely city and September is a good time to visit it

Physics of Biological Action and Perception Mark L. Latash, 2019-09-05 *Physics of Biological Action and Perception* helps researchers interested in exploring biological motor control from a physics or alternative viewpoint perspective The book introduces the idea of parametric control as a distinguishing feature of living systems Sections cover how the CNS creates stable percepts based on fuzzy and continuously changing signals from numerous receptors and the variable processes related to ongoing actions The author also develops the idea of control with referent coordinates to stability of salient variables in fields typically united under the label of cognition Examples of this include communication how the gist of a message is preserved despite variability of phrases thought processes how one can solve a mental problem via different logical routes and playing chess how one selects an optimal move given a position on the board The book is written for researchers instructors clinicians and other professionals in all the fields related to biological movement and perception Presents a unifying theory of motor control based on physics Encompasses action perception and cognition Discusses referent coordinates kinesthetic perception and stability of actions Identifies the importance of the CNS over computational brain function

Motor Control and Learning Richard A. Schmidt, 1988 *Re-Enacting Sensorimotor Experience for Cognition* Guido Schillaci, Verena V. Hafner, Bruno Lara, 2017-03-29 Mastering the sensorimotor capabilities of our body is a skill that we acquire and refine over time starting at the prenatal stages of development This learning process is linked to brain development and is shaped by the rich set of multimodal information experienced while exploring and interacting with the environment Evidence coming from neuroscience suggests the brain forms and maintains body representations as the main strategy to this mastering Although it is still not clear how this knowledge is represented in our brain it is reasonable to think that such internal models of the body undergo a continuous process of adaptation They need to match growing corporal dimensions during development as well as temporary changes in the characteristics of the body such as the transient morphological alterations produced by the usage of tools In the robotics community there is an increasing interest in reproducing similar mechanisms in artificial agents mainly motivated by the aim of producing

autonomous adaptive systems that can deal with complexity and uncertainty in human environments Although promising results have been achieved in the context of sensorimotor learning and autonomous generation of body representations it is still not clear how such low level representations can be scaled up to more complex motor skills and how they can enable the development of cognitive capabilities Recent findings from behavioural and brain studies suggests that processes of mental simulations of action perception loops are likely to be executed in our brain and are dependent on internal motor representations The capability to simulate sensorimotor experience might represent a key mechanism behind the implementation of further cognitive skills such as self detection self other distinction and imitation Empirical investigation on the functioning of similar processes in the brain and on their implementation in artificial agents is fragmented This e book comprises a collection of manuscripts published by Frontiers in Robotics and Artificial Intelligence under the section Humanoid Robotics on the research topic re enactment of sensorimotor experience for cognition in artificial agents This compendium aims at condensing the latest theoretical review and experimental studies that address new paradigms for learning and integrating multimodal sensorimotor information in artificial agents re use of the sensorimotor experience for cognitive development and further construction of more complex strategies and behaviours using these concepts The authors would like to thank M A Dylan Andrade for his art work for the cover

A Multilevel Approach to the Study of Motor Control and Learning Debra J. Rose, Robert W. Christina, 2006 This up to date book provides a comprehensive introduction to the principles of motor control and motor learning The authors integrate knowledge from the fields of cognitive psychology and neuroscience to provide readers with a more complete understanding of the multilevel processes that contribute to the acquisition and control of movement skills Each section of the book introduces the most important theoretical models in each particular area followed by theoretical principles and illustrations with practical examples drawn from movement skill and clinical settings The breadth of the practical applications will appeal to readers preparing to enter professions that require a strong knowledge of motor control and learning principles Movement skill cognitive psychology neuroscience transfer of motor learning contemporary motor control theories measurement techniques application of theory real life aspects of motor control and learning For all readers interested in issues relating to motor learning and control

The Sensorimotor Control of Object Manipulation and Tool Use James Neilson Ingram, 2013 [The Acquisition of Motor Behavior in Vertebrates](#) James R. Bloedel, Timothy J. Ebner, Steven P. Wise, 1996 Our motor skills determine how well we perform in athletics dance music and in carrying out countless daily chores While our proficiency at performing individual actions and synthesizing them into seamless sequences limits our athletic and artistic talents we are not perpetually bound by such limitations The nervous system can acquire new and modify old motor behaviors through experience and practice That is motor learning The Acquisition of Motor Behavior in Vertebrates provides a broad multidisciplinary survey of recent research on the brain systems and mechanisms underlying motor learning Following the editors introduction nineteen contributions

report on the neurobiology of these higher brain functions and on diverse types of motor learning such as reflex adaptation conditioned and instrumental reflex learning visually guided actions and complex sequences and skills

From Stimulus to Behavioral Decision-Making Gérard Manière, Gérard Coureaud, 2020-02-13 The proper detection of stimuli coming from the environment is vital for any organism in vertebrates as in invertebrates Animals use different sensory modalities independently or simultaneously to detect them such as audition vision olfaction taste and touch Indeed in their ecosystems animals constantly perceive various sensory signals These stimuli come either from the environment light temperature humidity salinity or from other organisms calls colors movements pheromones allomones This eBooks combines studies and comments research articles reviews opinions dealing with how animals detect a precise simple or complex sensory signal confer a value to that signal and respond to it by devoted and adaptive behaviors This eBook provides a general overview for the detection of identified stimuli and the mechanisms that lead to decision making in animals It also highlights the differences and similarities that may exist between vertebrates and invertebrates

Motor Control in Everyday Actions Timothy Donald Lee, 2011 Motor Control in Everyday Actions presents 47 true stories that illustrate the phenomena of motor control learning perception and attention in sport physical activity home and work environments At times humorous and sometimes sobering this unique text provides an accessible application to research approach to spark critical thinking class discussion and new ideas for research The stories in Motor Control in Everyday Actions illustrate the diversity and complexity of research in perception and action and motor skill acquisition More than interesting anecdotes these stories offer concrete examples of how motor behavior motor control and perception and action errors affect the lives of both well known and ordinary individuals in various situations and environments Readers will be entertained with real life stories that illustrate how research in motor control is applicable to real life Choking Under Pressure examines information processing and how it changes under pressure The Gimme Putt shows how Schmidt s law can be used to predict the accuracy of golf putts Turn Right at the Next Gorilla examines inattention blindness and its role in traffic accidents The Farmers Market describes reasons why a man drives his car through a crowded open air market killing and injuring dozens of shoppers in the process Craps and Weighted Bats describes the curious role of myths and superstition in how we play games And 42 other examples of motor control in everyday actions will both entertain and inform Each story is followed by a set of self directed activities that are progressively more complex These activities plus the additional notes and suggested readings and websites at the conclusion of each story provide a starting point for critical thinking about the reasons why human actions sometimes go awry A reader friendly writing style and easy to follow analysis and conclusions assist students in gaining mastery of the issues presented conceptualizing new research projects and applying the content to current research The stories are grouped into three parts beginning with situations involving errors and mistakes in perception action or decision making Next stories investigating varied techniques for studying perception and action are presented The remaining scenarios provide readers
