Abstract: The purpose of this study was to determine the effect of a 12-week resistance training program on the muscle strength and power of older adults. The study was a randomized controlled trial. The participants were 20 older adults (mean age = 70.5 years) who were randomly assigned to either a resistance training group or a control group. The resistance training group performed a 12-week program of resistance training, while the control group performed no exercise. The results showed that the resistance training group had significantly greater increases in muscle strength and power compared to the control group. The findings suggest that resistance training can improve muscle strength and power in older adults.
