Scientific Computing - An Introduction using Maple and MATLAB Walter Gander, Martin J. Gander, Felix Kwok, 2014-04-23 Scientific computing is the study of how to use computers effectively to solve problems that arise from the mathematical modeling of phenomena in science and engineering It is based on mathematics numerical and symbolic algebraic computations and visualization This book serves as an introduction to both the theory and practice of scientific computing with each chapter presenting the basic algorithms that serve as the workhorses of many scientific codes we explain both the theory behind these algorithms and how they must be implemented in order to work reliably in finite precision arithmetic The book includes many programs written in Matlab and Maple Maple is often used to derive numerical algorithms whereas Matlab is used to implement them The theory is developed in such a way that students can learn by themselves as they work through the text Each chapter contains numerous examples and problems to help readers understand the material hands on

Thermal Issues in Testing of Advanced Systems on Chip Nima Aghaee Ghalesahi, 2015-09-23 Many cutting edge computer and electronic products are powered by advanced Systems on Chip SoC Advanced SoCs encompass superb performance together with large number of functions This is achieved by efficient integration of huge number of transistors Such very large scale integration is enabled by a core based design paradigm as well as deep submicron and 3D stacked IC technologies These technologies are susceptible to reliability and testing complications caused by thermal issues Three crucial thermal issues related to temperature variations temperature gradients and temperature cycling are addressed in this thesis Existing test scheduling techniques rely on temperature simulations to generate schedules that meet thermal constraints such as overheating prevention The difference

between the simulated temperatures and the actual temperatures is called temperature error. This error for past technologies is negligible. However, advanced SoCs experience large errors due to large process variations. Such large errors have costly consequences such as overheating and must be taken care of. This thesis presents an adaptive approach to generate test schedules that handle such temperature errors. Advanced SoCs manufactured as 3D stacked ICs experience large temperature gradients. Temperature gradients accelerate certain early life defect mechanisms. These mechanisms can be artificially accelerated using gradient based burn in like operations so that the defects are detected before shipping. Moreover, temperature gradients exacerbate some delay related defects. In order to detect such defects, testing must be performed when appropriate temperature gradients are enforced. A schedule based technique that enforces the temperature gradients for burn in like operations is proposed in this thesis. This technique is further developed to support testing for delay related defects while appropriate gradients are enforced. The last thermal issue addressed by this thesis is related to temperature cycling. Temperature cycling test procedures are usually applied to safety critical applications to detect cycling related early life failures. Such failures affect advanced SoCs particularly through silicon via structures in 3D stacked ICs. An efficient schedule based cycling test technique that combines cycling acceleration with testing is proposed in this thesis. The proposed technique fits into existing 3D testing procedures and does not require temperature chambers. Therefore, the overall cycling acceleration and testing cost can be drastically reduced. All the proposed techniques have been implemented and evaluated with extensive experiments based on ITC 02 benchmarks as well as a number of 3D stacked ICs. Experiments show that the proposed techniques work effectively and reduce the costs, in particular the costs related to addressing thermal issues and early life failures. We have also developed a fast temperature simulation technique based on a closed form solution for the temperature equations. Experiments demonstrate that the proposed simulation technique reduces the schedule generation time by more than half.
