Ultrasonic Transducer Materials O. E. Mattiat, 2013-03-13 In recent years remarkable progress has been made in the development of materials for ultrasonic transducers There is a continuing trend towards increasingly higher frequency ranges for the application of ultrasonic transducers in modern technology The progress in this area has been especially rapid and articles and papers on the subject are scattered over numerous technical and scientific journals in this country and abroad Although good books have appeared on ultrasonics in general and ultrasonic transducers in particular in which for obvious reasons materials play an important part no comprehensive treatise is available that represents the state of the art on modern ultrasonic transducer materials This book intends to fill a need for a thorough review of the subject Not all materials are covered of which theoretically ultrasonic transducers could be made but those that are or may be of technical importance and which have inherent electro acoustic transducer properties i e materials that are either magnetostrictive electrostrictive or piezoelectric The book has been divided into three parts which somewhat reflect the historic development of ultrasonic transducer materials for important technical application Chapter 1 deals with magnetostrictive materials magnetostrictive metals and their alloys and magnetostrictive ferrites polycrystalline ceramics The metals are useful

especially in cases where ruggedness of the transducers are of overriding importance and in the lower ultrasonic frequency range

Power Sonic and Ultrasonic Transducers Design Bernard Hamonic, Jean N. Decarpigny, 2012-12-06 This volume contains the Proceedings of the International Workshop on the Design of Power Sonic and Ultrasonic Transducers which was held in the Maison de l'Entreprise et des Technologies Nouvelles Marcq en Baroeul near Lille France on May 26 and 27 1987 The main objective of this Workshop was to discuss all aspects of high power problems in the design of electroacoustic transducers and to stimulate an exchange of knowledge and experience between researchers and industrialists involved in this multidisciplinary field The scientific program included 13 invited contributions and there were 80 participants from England France Italy Spain Sweden and the United States The editors wish to thank the authors and attendees for their active participation and they hope that these Proceedings will allow readers to share in the stimulating atmosphere of the sessions They also wish to thank everyone who undertook simultaneous translation clerical work typing of the Proceedings production of the illustrations or any other of the numerous tasks connected with this venture Special mention has to be made of Mrs E Litton ISEN Lille for her constant and kind help from the beginning of the project to the very end of the editing Dr R Bossut ISEN Lille for his efficient proofreading and Dr H U Daniel Springer Verlag for his interest in these Proceedings as well as his kind and efficient support

Transducers and Arrays for Underwater Sound Charles Sherman, John Butler, 2007-01-05 The efficacy of sound to penetrate the seas made acoustic systems in the past century the leading tools for sensing objects in and measuring properties of the seas For over sixty years The United States Office of Naval Research ONR has been a major sponsor of undersea research and development at universities national laboratories and industrial organizations Appropriately ONR is the sponsor of this monograph series The intent of the series is to summarize recent accomplishments in and to outline perspectives for underwater acoustics in specific fields of research The general field has escalated in importance and spread broadly with richness and depth of understanding It has also quite naturally become more specialized The goal of this series is to present monographs that critically review both past and recent accomplishments in order to address the shortcomings in present understanding In this way these works will bridge the gaps in understanding among the specialists and favorably color the direction of new research and development Each monograph is intended to be a stand alone advanced contribution to the field We trust that the reader will also find that each is a critical introduction to related specialized topics of interest as well

Influence of Ceramic Location on Ultrasonic Transducer Performance Robert Allen LeMaster, 1978

An Evaluation of 1-3 Connectivity Composite Transducers for Air-coupled Ultrasonic Applications Anthony Gachagan, 1996 Conventional ultrasonic non destructive evaluation techniques require some form of liquid coupling between the piezoelectric transducer and the sample under inspection to facilitate

mechanical energy transfer Under automated conditions maintaining a consistent couplant layer can constitute a problem and is manifest in slower scanning rates To improve scanning speed the ultrasound should ideally propagate across an intermediate airgap This possibility has been inhibited by the lack of a suitable transducer technology to overcome the practical difficulties inherent in the air medium The large acoustic impedance mismatch between a piezoelectric element and air and the large air attenuation factor ensures both poor sensitivity and resolution characteristics This Thesis advances transducer technology enabling these problems to be challenged effectively Initially the Thesis describes the creation of a wideband characterisation methodology for aircoupled ultrasonic transducers operating in the range 100kHz 2MHz The proposed technique utilises piezopolymer transducers in both transmission and reception modes and despite the obvious measurement difficulties good agreement between theory and experiment is illustrated Results are presented on the characterisation of both electrostatic and 1 3 connectivity piezocomposite devices in which the inherent narrowband nature of the piezocomposite transducer demonstrates considerable potential for airborne applications Subsequently the performance of air coupled 1 3 connectivity piezocomposite transducers is investigated using both uni dimensional and finite element modelling techniques Experimental verification of these techniques enables the finite element approach to be used as the benchmark for evaluation of practical transducer configurations Consequently a series of design guidelines are presented for practical air coupled composite transducer systems For many applications the conventional method to improve system resolution through attachment of a backing block produces an unacceptably low system sensitivity Hence an alternative approach is proposed utilising strong coupling between the fundamental thickness mode and the first lateral resonance in a 1 3 piezocomposite Finite element analysis has been employed in the design of a laterally coupled composite receiver and a 6dB bandwidth of 150% at a centre frequency of 1 MHz is presented Finally the new transducer design techniques were applied to three different airborne non destructive testing applications Successful detection of various defects in carbon fibre reinforced composite plates is demonstrated *Ultrasonic Transducers* Yoshimitsu Kikuchi,1969

Acoustic Transducers Ivor D. Groves,1981 **Transducers and Arrays for Underwater Sound** Charles H.

Sherman,John L. Butler,2011-04-06 The most comprehensive book on electroacoustic transducers and arrays for underwater sound Includes transducer modeling techniques and transducer designs that are currently in use Includes discussion and analysis of array interaction and nonlinear effects in transducers Contains extensive data in figures and tables needed in transducer and array design Written at a level that will be useful to students as well as to practicing engineers and scientists

Ultrasonic Transducers for Nondestructive Testing, Maurice G. Silk,1984-01-01 **Micromachined Ultrasonic**

Transducers Butrus T. Khuri-Yakub,G. Percin,2005-11-01 The aim of this book is to teach the design and construction of micromachined ultrasonic transducers an area rapidly increasing in popularity and contrast and compare these transducers to each other and to traditional piezoelectric transducers Micromachined ultrasonic transducers are gaining wide acceptance

because of the use of silicon micromachining for their manufacture This also enables capabilities of these transducers that outperform piezoelectric transducers and enable configurations that are practically impossible otherwise This book teaches the principles of operations of micromachined ultrasonic transducers The theory of their operation and the technology of their manufacturing will be discussed and compared to that of traditional piezoelectric transducers Specific to the field of ultrasonic transducers Micromachined Ultrasonic Transducers is directed at the communities that use ultrasound in the frequency range of kHz to many MHz for use in airborne and immersion applications
