

Example 4.

What is the solution to this system of equations?

$$y = 2x - 9$$

$$y = -x + 3$$

Solution.

To solve by elimination, multiply by a factor such that when the equations are added, one variable is eliminated.

$y = 2x - 9$		$y = 2x - 9$		Solve for x .
$2(y = -x + 3)$	$\rightarrow$	$\frac{2y = -2x + 6}{3y = -3}$	$\longrightarrow$	$y = 2x - 9$
		$y = -1$		$-1 = 2x - 9$
				$2x = 8$
				$x = 4$

Coordinates of the point of intersection: (4, -1)

Adams,2009-02-16 Still another book on finite math Why Hasnt everything that should have been said been said No I would argue The shortcoming that troubles me most about the books I am familiar with is their failure to provide perspective on what math technique and the use of technology can do for us and its limitations This can only be addressed through vigorous and sustained use of the mathematical modeling perspective which is a hallmark of this books exposition A point continually stressed is that reaching a mathematical answer to a problem is not the end of the story It is in a sense the end of a chapter but the next chapter is concerned with questions about whether and how the mathematical answer should be implemented Also addressed is the question of what to consider when more than one answer is obtained for a problem **Mathematica for Physicists and**
