the impact of jet emissions on ground level and global air pollution and 2 federal agencies roles controlling in jet aircraft emissions GAO found that 1 jet aircraft emissions account for only 0.3 percent of hydrocarbon nitrogen oxide and carbon monoxide emissions produced nationwide 2 jet engines built after 1982 produce 58 percent less of all three types of emissions 3 officials from four cities with air pollution problems stated that jet aircraft emissions were a small source of pollution and it was more cost effective to focus on large sources of pollution 4 jets currently contribute a relatively small amount of carbon dioxide emissions to global pollution 5 the National Aeronautics and Space Administration NASA agrees that supersonic jets flying in the stratosphere are not a threat to the upper ozone layer but if fleet projections are correct and technology developments cannot reduce emissions to offset the increases it may be a concern in the future 6 due to concerns regarding the potential impact of jet aircraft emissions at the global level the Environmental Protection Agency EPA plans to add a staff position to monitor NASA research on the effect of jet emissions on upper level ozone depletion problems 7 EPA establishes aircraft emission standards and directs the Federal Aviation Administration FAA to enforce those standards 8 EPA established a hydrocarbon standard in 1982 that reduced hydrocarbon and carbon monoxide emissions from jet engines 9 FAA also represents the U.S. position on jet aircraft emissions in the international forum that sets ground level emissions standards and 10 NASA studies the global impact of jet aircraft emissions and is developing engine technology to reduce such emissions

Law School,1998 Selected Issues in Exhaust Emissions from Aviation Engines Jerzy Merkisz,2014 Works related to identification of harmful exhaust

components from aviation engines have continued since the second half of the last century These works focus on high thrust turbine engines For this group testing and standardization procedures have been developed containing the admissible limits of exhaust components Since 2007 works have been underway related to the identification of harmful exhaust components from engines of low power output that have not yet been included in the emissions legislation These actions are particularly

related to the measurements of the exhaust emissions from piston aviation engines and they are focused on the fuel applied for these engines This book presents the results of the author s own research work related to the issues of exhaust emissions from powertrains of aircraft and helicopters fitted with piston or turbine engines not yet included in the emission legislation Research has been presented for turbocharged piston and jet engines aircraft Test procedures have been presented related to the measurement of the exhaust emission under actual conditions of operation The study presents analyses of the operating conditions of aviation engines for which data from the on board recording devices flight parameters have been used Tests have been developed related to the engines operating under actual operating in flight conditions The methodology of the developed test has been validated based on a test dedicated for an aircraft fitted with a jet engine The test results have been subject to a comparison with the results of tests applicable in the homologation procedures Eventually the authors proposed exhaust emissions tests dedicated to individual aircraft groups

Engine Emissions George S. Springer, Donald J. Patterson, 1973 In recent years emissions from transportation engines have been studied widely because of the contribution of such engines to atmospheric pollution During this period the amounts of pollutants emitted the mechanism of their formation and means of controlling emissions have been investigated in industrial and government laboratories as well as at universities The results of these investigations have generally been published as individual articles in journals transactions meeting proceedings and frequently in company reports This proliferation of technical information makes it difficult for workers in the field to keep abreast of all developments For this reason the editors felt the need for a book which would survey the existing state of knowledge in wide albeit selected areas and would provide a guide to the relevant literature This book is intended to fulfill this function It is recognized that all aspects of transportation engine emissions cannot be explored in a single volume In this book attention is focused primarily on sources and mechanisms of emission formation within the combustion process and on measurement techniques Beyond this objective no restrictions were placed on the authors Within the framework of the general theme each author has been free to treat his subject as he saw fit The editors have not strived to replace by uniformity the highly personal and attractive divergences of style Considerable efforts were made however to ensure clarity and minimum overlap between the chapters
