

AIRCRAFT LOADS

Aircraft loads are those forces and loadings applied to the airplane structural components to establish the strength level of the complete airplane.

The determination of design loads involves a study of the air pressures and inertia forces during certain prescribed maneuvers, either in the air or on the ground.

Aircraft loads is the science of determining the loads that an aircraft structures must be designed to withstand. A large part of the forces that make up design loads are the forces resulting from the flow of air about the airplane's surfaces – the same forces that enable flight and control of the aircraft.

AIRCRAFT STRUCTURES I

AIRCRAFT EXTERNAL LOADS

Aircraft External loads are generally defined as those forces and loads applied to the aircraft structural components to establish the strength level of the complete aircraft. The strength level, or structural criteria, is defined by the aircraft speed, load factors, and maneuvers the aircraft must be capable of performing.

AIRCRAFT STRUCTURES I

Airplane loads come from diverse sources. These include (from FAR subpart ; Structures)

1. Component and payload weight *C.G*
2. Air loads: lift, drag, gusts *AERODYNAMICS*
3. Acoustic Loads *VN - DIAGRAM*
4. Thermal Loads
5. Landing Loads: touchdown, arresting
6. Take-off loads: runway taxi, catapult, assisted (e.g jet)

Inertia loads are primary source of loads for aircraft and arise because of accelerations created by engine thrust, maneuvers or gust conditions.

The concept of the load factor or g-force is used to describe inertia loads created by acceleration and resisted by the structural components to keep it acting as a unit.

How do we compute inertia loads?
