Memory Management for Developers Ted Neward,2017 Garbage Collection in Distributed Memory Systems Ali Al Hour,2014-04 Garbage Collection GC is a critical memory management process in programming languages based on dynamic object creation and automatic reclamation of storage The problem of the GC for uni processor systems has been well understood with many efficient solutions proposed and used GC algorithms have been also proposed and used for shared memory systems However few GC algorithms have been proposed for distributed memory system In this thesis a new GC algorithm for distributed memory system called Mark and Copy Garbage Collection M CGC is proposed The algorithm is based on parallel copying GC algorithm combining with some aspects of Mark Sweep GC and Copying GC algorithms M CGC has been implemented and evaluated using an underlying architecture with different network topology linear ring and mesh The performance of our algorithm is compared with the Mark and Sweep Garbage Collection M SGC which proposed by McCarthy but in distributed environment Analysis of evaluation results shows that our algorithm always out performs the M SGC algorithm with respect to total execution time **Algorithms and Data Structures for External Memory** Jeffrey Scott Vitter,2008 Describes several useful paradigms for the design and implementation of efficient external memory EM algorithms and data structures The problem domains considered include sorting permuting FFT scientific computing computational geometry graphs databases geographic information systems and text and string processing **Memory Management and Garbage Collection Algorithms for Java-based Prolog** ,2001 **Algorithms for Memory Hierarchies** Ulrich Meyer,Peter Sanders,2003-04-07 Algorithms that have to process large data sets have to take into account that the cost of memory access depends on where the data is stored Traditional algorithm design is based on the von Neumann model where accesses to memory have uniform cost Actual machines increasingly deviate from this model while waiting for memory access nowadays microprocessors can in principle execute 1000 additions of registers for hard disk access this factor can reach six orders of magnitude The 16 coherent chapters in this monograph like tutorial book introduce and survey algorithmic techniques used to achieve high performance on memory hierarchies emphasis is placed on methods interesting from a theoretical as well as important from a practical point of view Small Memory Software James Noble,Charles Weir,2001 The phenomenal increases in processing power and memory capacity of computing hardware over recent years have allowed manufacturers to produce smaller and smaller computer systems such as palmtop PCs smart cards

and embedded control systems on domestic and industrial appliances New techniques such as dynamic memory management and object orientation help programming but tend to require additional memory Standard programming techniques do not cope with these limited memory capacity environments This book will provide practical help for programmers developing software for this kind of environment The major content is a series of patterns developed by the authors based on solutions which have been found to work in real life situations They range from small system design patterns and process management patterns to patterns for User Interface development compression and memory storage This book will appeal to developers using Windows CE or building mobile telephones smart cards embedded devices set top computers in short all programmers working with memory constrained systems

A Language-independent Garbage Collector Toolkit Richard L.

Hudson, University of Massachusetts at Amherst. Department of Computer and Information Science, J. E. B. Moss, A.

Diwan, 1991 Abstract We describe a memory management toolkit for language implementors It offers efficient and flexible generation scavenging garbage collection In addition to providing a core of language independent algorithms and data structures the toolkit includes auxiliary components that ease implementation of garbage collection for programming languages We have detailed designs for Smalltalk and Modula 3 and are confident the toolkit can be used with a wide variety of languages The toolkit approach is itself novel and our design includes a number of additional innovations in flexibility efficiency accuracy and cooperation between the compiler and the collector
