introduced to provide solutions Machine designers realized very early that manufacturing processes do not produce the nominal dimensions of designed parts The notion of associating a lower and an upper limit referred to as tolerances with each dimension was introduced Tolerances were specified to ensure the proper function of mating features Fits of mating features included clearances location fits and interference fits with various sub grades in each category assigned a tolerance value depending on the nominal size of the mating features During the inspection process a part is rejected if a dimension fell outside the specified range As the accuracy requirements in assemblies became tighter designers had to consider other critical dimensions and allocate tolerances to them in order to ensure the assembly's functionality Iso Gps Ultimate Pocket Guide ,2015
