A High-Rate Virtual Instrument of Marine Vehicle Motions for Underwater Navigation and Ocean Remote Sensing Chrystel Gelin,2012-08-22 Dead Reckoning aided with Doppler velocity measurement has been the most common method for underwater navigation for small vehicles Unfortunately DR requires frequent position recalibrations and underwater vehicle navigation systems are limited to periodic position update when they surface Finally standard Global Positioning System GPS receivers are unable to provide the rate or precision required when used on a small vessel To overcome this a low cost high rate motion measurement system for an Unmanned Surface Vehicle USV with underwater and oceanographic purposes is proposed The proposed onboard system for the USV consists of an Inertial Measurement Unit IMU with accelerometers and rate gyros a GPS receiver a flux gate compass a roll and tilt sensor and an ADCP Interfacing all the sensors proved rather challenging because of their different characteristics The proposed data fusion technique integrates the sensors and develops an embeddable software package using real time data fusion methods for a USV to aid in navigation and control as well as controlling an onboard Acoustic Doppler Current Profiler ADCP While ADCPs non intrusively measure water flow the vessel motion needs to be removed to analyze the data and the system developed provides the motion measurements and processing to accomplish this task

Encyclopedia of Snow, Ice and Glaciers Vijay P. Singh,Pratap Singh,Umesh K. Haritashya,2011-06-29 The earth s cryosphere which includes snow glaciers ice caps ice sheets ice shelves sea ice river and lake ice and permafrost contains about 75% of the earth s fresh water It

exists at almost all latitudes from the tropics to the poles and plays a vital role in controlling the global climate system. It also provides direct visible evidence of the effect of climate change and therefore requires proper understanding of its complex dynamics. This encyclopedia mainly focuses on the various aspects of snow, ice, and glaciers but also covers other cryospheric branches and provides up-to-date information and basic concepts on relevant topics. It includes alphabetically arranged and professionally written comprehensive and authoritative academic articles by well-known international experts in individual fields. The encyclopedia contains a broad spectrum of topics ranging from the atmospheric processes responsible for snow formation, transformation of snow to ice, and changes in their properties; classification of ice and glaciers and their worldwide distribution; glacialiation and ice ages; glacier dynamics; glacier surface and subsurface characteristics; geomorphic processes and landscape formation; hydrology and sedimentary systems; permafrost degradation; hazards caused by cryospheric changes and trends of glacier retreat on the global scale along with the impact of climate change. This book can serve as a source of reference at the undergraduate and graduate level and help to better understand snow, ice, and glaciers. It will also be an indispensable tool containing specialized literature for geologists, geographers, climatologists, hydrologists, and water resources engineers as well as for those who are engaged in the practice of agricultural and civil engineering, earth sciences, environmental sciences, and engineering ecosystem management and other relevant subjects. **Handbook of Water**

The Earth's Hydrological Cycle L. Bengtsson,R.-M. Bonnet,M. Calisto,G. Destouni,R. Gurney,J. Johannessen,Y. Kerr,W.A. Lahoz,M. Rast,2014-05-02 This book gives a comprehensive presentation of our present understanding of the Earth s Hydrological cycle and the problems consequences and impacts that go with this topic Water is a central component in the Earth s system It is indispensable for life on Earth in its present form and influences virtually every aspect of our planet s life support system On relatively short time scales atmospheric water vapor interacts with the atmospheric circulation and is crucial in forming the Earth s climate zones Water vapor is the most powerful of the greenhouse gases and serves to enhance the tropospheric temperature The dominant part of available water on Earth resides in the oceans Parts are locked up in the land ice on Greenland and Antarctica and a smaller part is estimated to exist as groundwater If all the ice over the land and all the glaciers were to melt the sea level would rise by some 80 m In comparison the total amount of water vapor in the atmosphere is small it amounts to 25 kg m² or the equivalent of 25 mm water for each column of air Yet atmospheric water vapor is crucial for the Earth s energy balance The book gives an up to date presentation of the present knowledge Previously published in Surveys in Geophysics Volume 35 No 3 2014
