Problem 5

First, we draw the diagram and label the blocks and all known information (known values):

P_1 is the output of block 1 (undisturbed)

$u_1(t)$ is the input of junction 2, as in diagram 1, say the output

P_2 is the output of junction 2 as in diagram 1, as $P_1 + u_1(t)$

We are given that: $\frac{P_2}{P_1} = \frac{\text{output}}{\text{input}} = \frac{1}{2}$

Since we are not given a time, let us choose one: $\frac{P_2}{P_1} = \frac{1}{2}$

Let the input to the first summing junction be $u_1(t)$ (i.e. P_1).

For simplicity, let us follow the signal from the input junction:

Block	Transfer Function	Input	Output
1	$\frac{1}{s}$	$u_1(t)$	P_1
2	$\frac{1}{s}$	$P_1 + u_1(t)$	P_2
3	$\frac{1}{s}$	P_2	P_3
4	$\frac{1}{s}$	P_3	P_4
5	$\frac{1}{s}$	P_4	P_5
6	$\frac{1}{s}$	P_5	P_6
7	$\frac{1}{s}$	P_6	P_7
8	$\frac{1}{s}$	P_7	P_8

Frank Lees, 2005-01-10 Over the last three decades the process industries have grown very rapidly with corresponding increases in the quantities of hazardous materials in process storage or transport. Plants have become larger and are often situated in or close to densely populated areas. Increased hazard of loss of life or property is continually highlighted with incidents such as Flixborough, Bhopal, Chernobyl, Three Mile Island, the Phillips 66 incident and Piper Alpha to name but a few. The field of Loss Prevention is and continues to be of supreme importance to countless companies, municipalities and governments around the world because of the trend for processing plants to become larger and often be situated in or close to densely populated areas, thus increasing the hazard of loss of life or property. This book is a detailed guidebook to defending against these and many other hazards. It could without exaggeration be referred to as the bible for the process industries. This is THE standard reference work for chemical and process engineering safety professionals. For years it has been the most complete collection of information on the theory, practice, design, elements, equipment, regulations and laws covering the field of process safety. An entire library of alternative books and cross referencing systems would be needed to replace or improve upon it, but everything of importance to safety professionals, engineers and managers can be found in this all encompassing reference. Instead, Frank Lees' world renowned work has been fully revised and expanded by a team of leading chemical and process engineers working under the guidance of one of the world's chief experts in this field, Sam Mannan, who is professor of chemical engineering at Texas A&M. Principles, practice, codes, standards, data and references needed by those practicing in the field.

Chapman & Hall's Complete Fundamentals of Engineering Exam Review Workbook

Professional Engineer Review Course, 2013-06-29 I am often asked the question, "Should I get my PE license or not?" Unfortunately, the answer is "Probably." First let's take a look at the licensing process and understand why it exists, then take a look at extreme situations for an attempt at a yes/no answer and finally consider the exams. All 50 states have a constitutionally defined responsibility to protect the public. From an engineering point of view, as well as many other professions, this responsibility is met by the process of licensure and in our case, the Professional Engineer License. Though there are different experience requirements for different states, the meaning of the license is common. The licensee demonstrates academic competency in the Fundamentals of Engineering by examination. Principles and Practices at PE time. The licensee demonstrates qualifying work experience at PE time. The licensee ascribes to the Code of Ethics of the NSPE and to the laws of the state of registration. Having presented these qualities, the licensee is certified as an Intern Engineer and the state involved has fulfilled its constitutionally defined responsibility to protect the public.
