Quantum Thermal Physics R. Prasad,2016-11-02 Covering essential areas of thermal physics this book includes kinetic
 theory classical thermodynamics and quantum thermodynamics The text begins by explaining fundamental concepts of the
 kinetic theory of gases viscosity conductivity diffusion and the laws of thermodynamics and their applications It then goes on
 to discuss applications of thermodynamics to problems of physics and engineering These applications are explained with the
 help of P V and P S H diagrams where necessary and are followed by a large number of solved examples and unsolved
 exercises The book includes a dedicated chapter on the applications of thermodynamics to chemical reactions Each
 application is explained by taking the example of an appropriate chemical reaction where all technical terms are explained
 and complete mathematical derivations are worked out in steps starting from the first principle **Modeling of End-Gas**
Autoignition for Knock Prediction in Gasoline Engines Andreas Manz,2016-08-18 Downsizing of modern gasoline
 engines with direct injection is a key concept for achieving future CO₂ emission targets However high power densities and
 optimum efficiency are limited by an uncontrolled autoignition of the unburned air fuel mixture the so called spark knock
 phenomena By a combination of three dimensional Computational Fluid Dynamics 3D CFD and experiments incorporating
 optical diagnostics this work presents an integral approach for predicting combustion and autoignition in Spark Ignition SI

engines The turbulent premixed combustion and flame front propagation in 3D CFD is modeled with the G equation combustion model i e a laminar flamelet approach in combination with the level set method Autoignition in the unburned gas zone is modeled with the Shell model based on reduced chemical reactions using optimized reaction rate coefficients for different octane numbers ON as well as engine relevant pressures temperatures and EGR rates The basic functionality and sensitivities of improved sub models e g laminar flame speed are proven in simplified test cases followed by adequate engine test cases It is shown that the G equation combustion model performs well even on unstructured grids with polyhedral cells and coarse grid resolution The validation of the knock model with respect to temporal and spatial knock onset is done with fiber optical spark plug measurements and statistical evaluation of individual knocking cycles with a frequency based pressure analysis The results show a good correlation with the Shell autoignition relevant species in the simulation The combined model approach with G equation and Shell autoignition in an active formulation enables a realistic representation of thin flame fronts and hence the thermodynamic conditions prior to knocking by taking into account the ignition chemistry in unburned gas temperature fluctuations and self acceleration effects due to pre reactions By the modeling approach and simulation methodology presented in this work the overall predictive capability for the virtual development of future knockproof SI engines is improved
