

Lesson 2 – Estimating the Instantaneous Rate of Change

Terminology

Instantaneous Rate of Change: An estimate of the rate of change of a function $y = f(x)$ at a specific value of the independent variable $x = a$; estimated using average rates of change for small intervals of the independent variable very close to $x = a$. THE SLOPE OF THE TANGENT LINE

Preceding Interval: an interval of the independent variable of the form $a - h \leq x \leq a$, where h is a small positive value; used to determine an average rate of change.

Following Interval: an interval of the independent variable of the form $a \leq x \leq a + h$, where h is a small positive value; used to determine an average rate of change.

Centered Interval: an interval of the independent variable of the form $a - h \leq x \leq a + h$, where h is a small positive value; used to determine an average rate of change. The instantaneous rate of change can be estimated by squeezing the centered intervals

Difference Quotient: if $P(a, f(a))$ and $Q(a + h, f(a + h))$ are two points on the graph of $y = f(x)$, then the instantaneous rate of change of y with respect to x at P can be estimated using

THE DIFFERENCE QUOTIENT

$$\frac{\Delta y}{\Delta x} = \frac{f(a + h) - f(a)}{h}$$

where h is a very small number. This expression is called the difference quotient.

Example 1

A small pebble is dropped into a 3.0m tall cylindrical tube filled with thick glycerine. A motion detector recorded the time and the total distance that the pebble fell after its release.

Time, $t(s)$	6.0	6.2	6.4	6.6	6.8	7.0
Distance, $d(t)$ (cm)	208.39	221.76	235.41	249.31	263.46	277.84

- a) Estimate the instantaneous rate of change when $t = 6.4$ seconds using the preceding interval method.

Mathematics for the Life Sciences provides present and future biologists with the mathematical concepts and tools needed to understand and use mathematical models and read advanced mathematical biology books It presents mathematics in

biological contexts focusing on the central mathematical ideas and providing detailed explanations The author assumes no mathematics background beyond algebra and precalculus Calculus is presented as a one chapter primer that is suitable for readers who have not studied the subject before as well as readers who have taken a calculus course and need a review This primer is followed by a novel chapter on mathematical modeling that begins with discussions of biological data and the basic principles of modeling The remainder of the chapter introduces the reader to topics in mechanistic modeling deriving models from biological assumptions and empirical modeling using data to parameterize and select models The modeling chapter contains a thorough treatment of key ideas and techniques that are often neglected in mathematics books It also provides the reader with a sophisticated viewpoint and the essential background needed to make full use of the remainder of the book which includes two chapters on probability and its applications to inferential statistics and three chapters on discrete and continuous dynamical systems The biological content of the book is self contained and includes many basic biology topics such as the genetic code Mendelian genetics population dynamics predator prey relationships epidemiology and immunology The large number of problem sets include some drill problems along with a large number of case studies The latter are divided into step by step problems and sorted into the appropriate section allowing readers to gradually develop complete investigations from understanding the biological assumptions to a complete analysis

B. Hart, John D.

Reynolds, 2008-04-15 Recent decades have witnessed strong declines in fish stocks around the globe amid growing concerns about the impact of fisheries on marine and freshwater biodiversity. Fisheries biologists and managers are therefore increasingly asking about aspects of ecology, behaviour, evolution, and biodiversity that were traditionally studied by people working in very separate fields. This has highlighted the need to work more closely together in order to help ensure future success both in management and conservation. The *Handbook of Fish Biology and Fisheries* has been written by an international team of scientists and practitioners to provide an overview of the biology of freshwater and marine fish species together with the science that supports fisheries management and conservation. This volume, subtitled *Fisheries*, focuses on a

wide range of topics including the history of fisheries science methods of capture marketing economics major models used in stock assessments and forecasting ecosystem impacts marine protected areas and conservation It builds on material in Volume 1 Fish Biology which ranges from phylogenetics and biogeography to physiology recruitment life histories genetics foraging reproductive behaviour and community ecology Together these books present the state of the art in our understanding of fish biology and fisheries and will serve as valuable references for undergraduates and graduates looking for a comprehensive source on a wide variety of topics in fisheries science They will also be useful to researchers who need up to date reviews of topics that impinge on their fields and decision makers who need to appreciate the scientific background for management and conservation of aquatic ecosystems To order volume II go to the box in the top right hand corner Alternatively to order volume I go to <http://www.blackwellpublishing.com/book.asp/ref/0632054123> or to order the 2 volume set go to <http://www.blackwellpublishing.com/book.asp/ref/0632064838> Provides a unique overview of the study of fish biology and ecology and the assessment and management of fish populations and ecosystems The first volume concentrates on aspects of fish biology and ecology both at the individual and population levels whilst the second volume addresses the assessment and management of fish populations and ecosystems Written by an international team of expert scientists and practitioners An invaluable reference tool for both students researchers and practitioners working in the fields of fish biology and fisheries Calculus: Single and Multivariable Deborah Hughes-Hallett, Andrew M.
