

CHAPTER 2: MULTIMODAL TRANSPORT: ITS EVOLUTION & APPLICATION

2.1 BACKGROUND

Multimodal transport is essentially an international through-transport combination with various modes of transport such as ship, rail, truck, aeroplane, etc., primarily through the use of containers. Containers will ensure the transport of unitised cargo from its origin to its final destination, with efficiency and least possible risk (UNCTAD, 1993).

According to Woxenius (1998), the concept of using freight containers dates from Roman times but container transport by rail was introduced by the Liverpool & Manchester Railway that used Roll-on/Roll-off containers for the hauling of coal back in 1830. The Birmingham & Derby Railway introduced an early form of multimodal transport with the transfer of containers between rail wagons and horse carriage in 1839. New York Central Railway developed and inaugurated the first dedicated container service from Cleveland and Chicago on March 19, 1921. Containerisation grew further as a means of 'door-to-door' transport, spurred on by the development of the Piggy Back System where trailers themselves were carried aboard specialised 'Flat cars' (ESCAP, 1983).

Containers for sea transport appeared during the 1960s and should be attributed to the innovativeness and the sea/land strategy of Mr. M McLean, the founder of Sea-Land Inc. (UNCTAD, 1993). He was originally an executive of a trucking company who took over a shipping company. As he was familiar with road/rail combination operations for land transport, he decided to apply the concept with sea transport to enable sea/land through transport with the help of standardised dimensions for containers. It followed that containers had to be fitted with special devices for the ease of switch between different modes of transport and that ships had to be equipped with rail structures known as cell-guides for vertical sliding and stowing into the ship's hold.
