Airline Operations And Scheduling:

Airline Operations and Scheduling Massoud Bazargan, 2016-03-23 Operations research techniques are extremely important tools for planning airline operations. However, much of the technical literature on airline optimization models is highly specialized and accessible only to a limited audience. Allied to this, there is a concern among the operations research community that the materials offered in OR courses at MBA or senior undergraduate business level are too abstract, outdated, and at times irrelevant to today's fast and dynamic airline industry. This book demystifies the operations and scheduling environment, presenting simplified and easy-to-understand models applied to straightforward and practical examples. After introducing the key issues confronting operations and scheduling within airlines, *Airline Operations and Scheduling* goes on to provide an objective review of the various optimization models adopted in practice. Each model provides airlines with efficient solutions to a range of scenarios and is accompanied by case studies similar to those experienced by commercial airlines. Using unique source material and combining interviews with alumni working at operations and scheduling departments of various airlines, this solution-oriented approach has been used on many courses with outstanding feedback. As well as having been comprehensively updated, this second edition of *Airline Operations and Scheduling* adds new chapters on fuel management systems, baggage handling, aircraft maintenance planning, and aircraft boarding strategies. The readership includes graduate and undergraduate business management, transportation, and engineering students; airlines training and acquainting new recruits with operations planning and scheduling processes; general aviation flight school; International Air Transport Association (IATA) and International Civil Aviation Organization (ICAO) training course instructors; executive jet, chartered flight, air cargo, and package delivery companies; and airline consultants.

Dynamic Scheduling in Airline Operations Ollie James Akel, 1967 Introduction Although air transportation has been characterized by rapid development in vehicle design and performance methods of airline management in the area of vehicle scheduling and control have advanced at a much slower pace Because of high costs of operation and the pressures of current competition and government controls effective and efficient use of aircraft is becoming an increasingly essential objective The goal is to achieve an optimal balance between net revenue to the airline and improved level of service to the customer Improved return implies higher load factors and air craft utilization whereas improved passenger service necessitates reduced waits and increased frequencies These are often conflicting aims New techniques must be mobilized to give management more useful and adaptive methods of operating and controlling an air transportation system Perhaps the particular requirements 1 of a very short haul high density transportation system will lead to more demand responsive approaches It is with this motivation that this study of dynamic dispatching strategy is undertaken

A New Approach for Disruption Management in Airline Operations Control António J. M. Castro, Ana Paula Rocha, Eugénio Oliveira, 2014-06-19 Most of the research efforts dealing with airline scheduling have been done on off line plan optimization However nowadays with the increasingly complex and huge traffic at airports the real challenge is how to react to unexpected events that may cause plan disruptions leading to flight delays Moreover these disruptive events usually affect at least three different dimensions of the situation the aircraft assigned to the flight the crew assignment and often forgotten the passengers journey and satisfaction This book includes answers to this challenge and proposes the use of the Multi agent System paradigm to rapidly compose a multi faceted solution to the disruptive event taking into consideration possible preferences of those three key aspects of the problem Negotiation protocols taking place between agents that are experts in solving the different problem dimensions combination of different utility functions and not less important the inclusion of the human in the automatic decision making loop make MASDIMA the system described in this book well suited for real life plan disruption management applications

Airline Operations Research Dusan Teodorovic, 2017-04-28 The increase in practical problems generated by the intensive growth in air transport has necessitated the development of specialised operations research methods and modern computer technology By combining operational research data from both scientific publications and airline companies this book first published in 1988 provides a unique source of information for those working on the development and application of operations research analysis in air transportation Topics include air transport analysis flight frequency determination the scheduling of flights and personnel and the problems of airline overbooking
