Bulletin of the American Mathematical Society, 2002. Cornell University Courses of Study Cornell University, 2007. Dynamical Systems, Graphs, and Algorithms George Osipenko, 2007. The modern theory and practice of dynamical systems requires the study of structures that fall outside the scope of traditional subjects of mathematical analysis. An important tool to investigate such complicated phenomena as chaos and strange attractors is the method of symbolic dynamics. This book describes a family of the algorithms to study global structure of systems. By a finite covering of the phase space we construct a directed graph symbolic image with vertices corresponding to cells of the covering and edges corresponding to admissible transitions. The method is used to localize the periodic orbits and the chain recurrent set to construct the attractors and their basins, to estimate the entropy, Lyapunov exponents and the Morse spectrum to verify the hyperbolicity and the structural stability. Considerable information can be obtained thus and more techniques may be discovered in future research.

Bulletin (new Series) of the American Mathematical Society, 2002. **Semialgebraic Statistics and Latent Tree Models** Piotr Zwiernik, 2015-08-21. The first part of the book gives a general introduction to key concepts in algebraic statistics focusing on methods that are helpful in the study of models with hidden variables. The author uses tensor geometry as a natural language to deal with multivariate probability distributions, develops new combinatorial tools to study models

with hidden data and describes the semialgebraic structure of statistical models. The second part illustrates important examples of tree models with hidden variables. The book discusses the underlying models and related combinatorial concepts of phylogenetic trees as well as the local and global geometry of latent tree models. It also extends previous results to Gaussian latent tree models. This book shows you how both combinatorics and algebraic geometry enable a better understanding of latent tree models. It contains many results on the geometry of the models including a detailed analysis of identifiability and the defining polynomial constraints.
